# Foreword

The purpose of this catalog is to show and describe briefly the popular types of General Electric lamps available for many important lighting services. Buyers and Sellers of lamps should find the catalog of great assistance in determining sizes and types needed and for properly identifying individual lamps. However it is not intended to be used as a source of technical information for lighting installations. G-E lighting engineers and engineering bulletins should be consulted for up-to-date technical data pertaining to lighting applications. These and other assistance you may require are available from your General Electric Large Lamp District Sales Office listed on the back cover.

Only lamps classified in the manufacturer's schedules and contracts as "Large Lamps" are included in this catalog. For certain services additional lamps classified other than "Large Lamps" are also available. For instance, there are available additional lamps for aviation services which are classified as miniature lamps and are listed in miniature lamp catalogs and schedules. Also additional projection lamps classified as photolamps are listed in photolamp catalogs and schedules.

# GENERAL ELECTRIC

## *catalog of large lamps*

Hospital Lamps . . . . .	65	Traffic Signal Lamps . . . . .	41
Indicator Lamps . . . . .	52	Train Lamps . . . . .	46-47
Infrared Lamps . . . . .	64	Tubular Lamps . . . . .	54
Locomotive Lamps . . . . .	46-47	Vibration Lamps . . . . .	51
		Yellow Lamps . . . . .	24

Lamps shown in this catalog are approximately one-third actual size except Fluorescent, Germicidal, Lumiline, and the H3000-9 Mercury Lamps. Colored lamps are shown in as close to actual colors as possible. Fluorescent lamps and the Surprise Pink Lumiline lamp are shown in approximately the colors as they appear when lighted.

# GENERAL ELECTRIC LEADERSHIP IN LAMP DEVELOPMENT

The test of a lamp's quality is how efficiently it produces light from the current it consumes. The objective of General Electric's extensive research work in lamp design and manufacturing processes is to make lamps of the highest possible quality — lamps that produce light for industrial, commercial and residential uses at the lowest possible cost.

To make the best lamp possible for a particular lighting service — factories, homes, airports, automobiles, picture projection, any one of thousands of applications — requires the highest skill in lamp design. Complete specification of every lamp part must be made for each type of lamp manufactured. There are at the present time about 700 different specifications for glass parts, 200 specifications for bases, about 6000 specifications for lead-in wires and supports, a countless variety of filament wires and specifications for more than 200 different chemicals or components.

Each specification, length and diameter of filament, spacing between coils, mandrel size and so forth is specified sometimes to a one hundred-thousandth part of an inch. A filament which in a single spot is 1% less in diameter (in a 6-watt lamp that is five-millionths of an inch) than specified, may reduce its life 25%. All specifications, for more than 10,000 different types of lamps, are continually reviewed and promptly revised when new data indicates a possible improvement that will mean lower cost of lamps, better quality of light or lower cost of lighting.

Essential also to uniform high quality in lamps is the development of lamp making machinery that will assure consistent accuracy of wattage, life and lumen ratings and all other design features. In this field General Electric has made many notable achievements, each one resulting in a more efficient lamp and a higher standard of quality for all lamps.

Comprehensive testing of lamps throughout all phases of manufacture, and testing of sample finished products in General Electric testing laboratories as well as by independent testing services provides a constant check on quality and assures that all established standards are maintained.

Filament lamps are designed for operation at specified voltages in order to give best performance. Mercury and fluorescent lamps with their auxiliary equipment are likewise designed for best performance within a range of specified voltages. For a discussion of the operating characteristics of all of these lamps see Application Engineering Bulletin LD 1.

G-E Lamp Division engineers are available for consultation on design of equipment using sources of visible, infrared and ultraviolet radiation . . . especially as to details of design to insure maximum performance of both lamps and equipment. The growing variety of lamps with differing physical and operating characteristics makes such checks increasingly desirable before designs are established. Experience has shown that subsequent service difficulties are often thus avoided.

Some of the new lamps developed by

- 1 500-watt R-40 Spot and Flood Lamps
- 2 Reflector Colored Lamps
- 3 Circline Lamps
- 4 400-watt Mercury Lamp
- 5 250-watt Red End Heat Lamp
- 6 FT-110 Lower Voltage Flash Tube
- 7 3000-watt T-32 Projection Lamp
- 8 BLB Fluorescent Lamps
- 9 200-watt PAR-46 Spotlight
- 10 50-watt and 100-watt GA Lamps
- 11 300-watt PAR-56 Spotlight

# MENT ASSURES BETTER LIGHTING AT LOWER COST

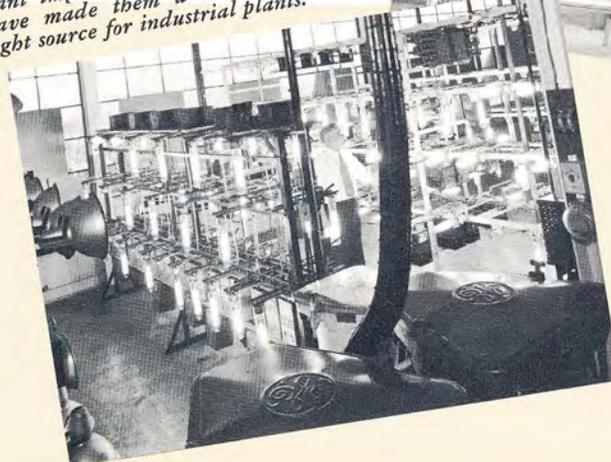

New processes, new materials, new parts and new types of lamps developed to meet specific needs are products of G. E. Research and Lamp Development. Some of the more recent include triple-coil cathode, high temperature basing cement, "Q" coating, deluxe colors, enameled lamps, aluminum bases, treated exhaust tubes, longer life fluorescent lamps, more efficient mercury lamps and many new types of lamps.

*This laboratory contains sockets for over 12000 incandescent lamps of all types and sizes. Voltage is controlled by electronic devices to within 1/10 of a volt in 120 volt circuits. Time of burning is determined by automatic time recorders.*

*Test operating conditions of slimline fluorescent lamps are checked regularly during life.*

*Practical operating tests and constant improvements in mercury lamps have made them a most economical light source for industrial plants.*

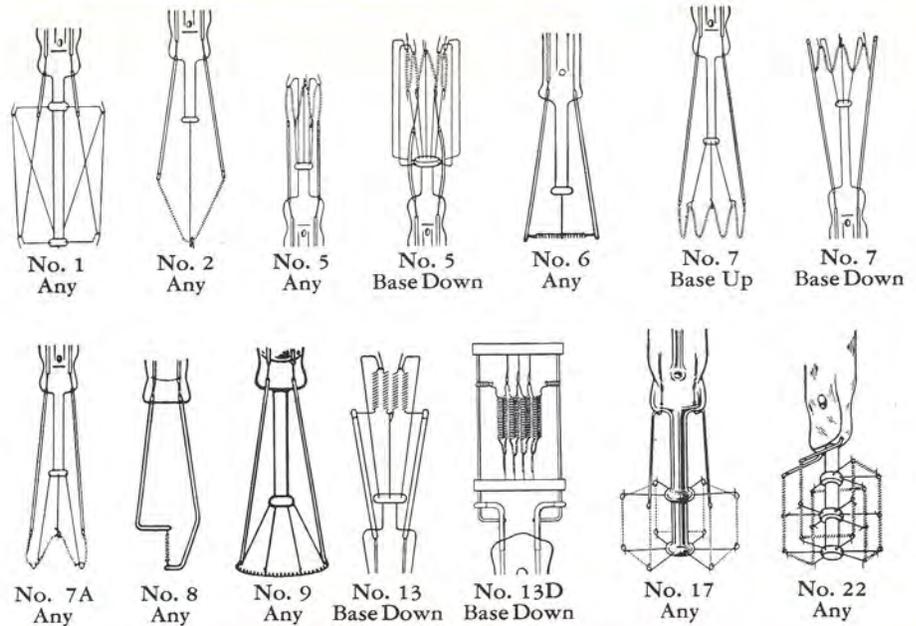

General Electric in recent years include:

- 12 500-watt and 750-watt R-52 Lamps
- 13 R-12 Airplane Reading Lamp
- 14 Q-Coated Lamps
- 15 250-watt, 375-watt and 500-watt G-30 Infra-red Lamps
- 16 200-watt and 300-watt Semi Silvered Bowl Lamps
- 17 Outside Enameled Colors
- 18 Slimline Lamps
- 19 G36T6 Germicidal Lamps
- 20 Quartz Infrared Heat Lamps
- 21 Ozone Lamp

# G-E FILAMENT LAMPS

## Filaments

Electric current passing through the filament must overcome its resistance and the power consumed heats the filament to incandescence. The almost universally used filament material is tungsten. The filament may be straight wire, a coil, or a coiled-coil (indicated respectively by the letters S, C and CC). Coiling the wire reduces gas losses, increases efficiency. The illustrations show some of the commonly used filament forms (numerals) and their specific burning positions.

### Gas

Used in most lamps of 40 watts and above, prevents rapid evaporation of the filament, permitting higher temperatures which result in higher efficiencies. Gas-filled lamps are indicated by the letter C, vacuum lamps by the letter B. Usual gas is a mixture of nitrogen and argon. Some lamps for special services may use krypton.

### Lead-in Wires

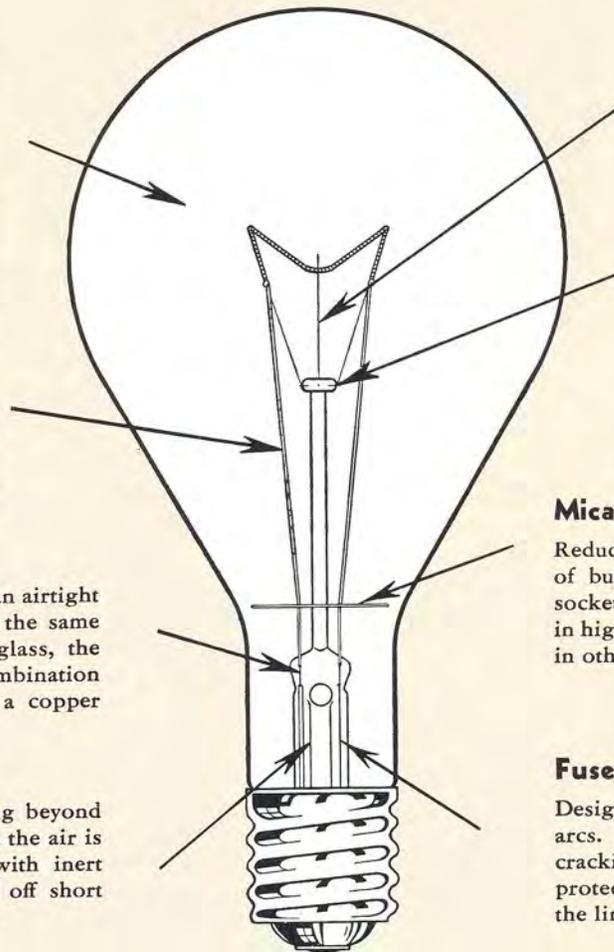

Conduct the current to and from the filament; copper used from base to stem press and nickel from stem press to filament.

### Stem Press

The glass and lead-in wires have an airtight seal here. To have substantially the same coefficient of expansion as the glass, the lead-in wire at this point is a combination of a nickel-iron alloy core and a copper sleeve (Dumet wire).

### Exhaust Tube

It is through this tube, projecting beyond the bulb during manufacture, that the air is exhausted and the bulb filled with inert gases. The tube is then sealed off short enough for the base to fit over it.

### Support Wires

Molybdenum wires hold the filament in place; minimum number desirable to reduce heat losses.

### Button

The glass is softened during assembly and the support wires stuck in it. It is supported by the button rod.

### Mica Disc

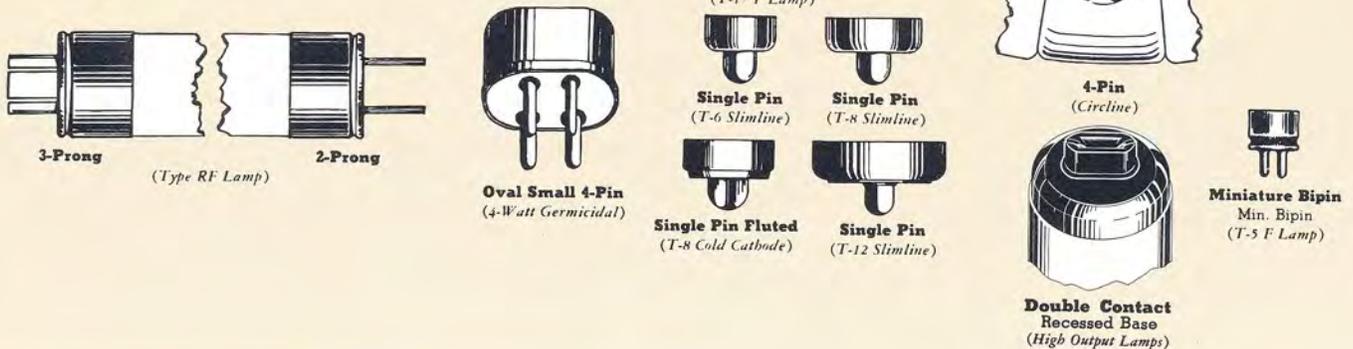

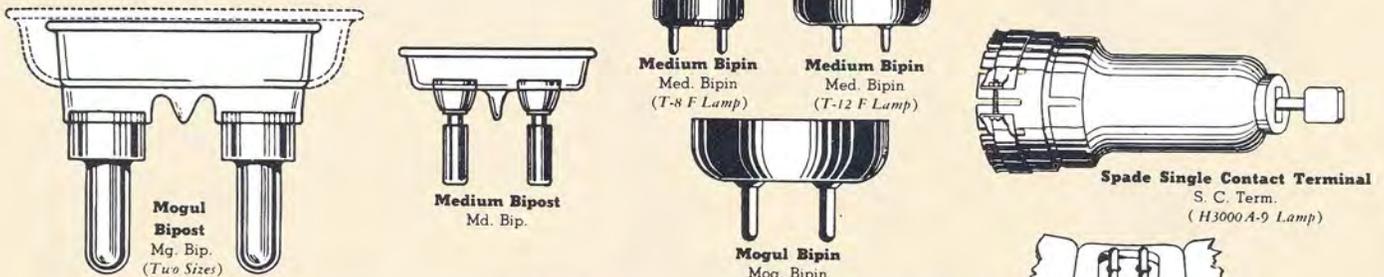

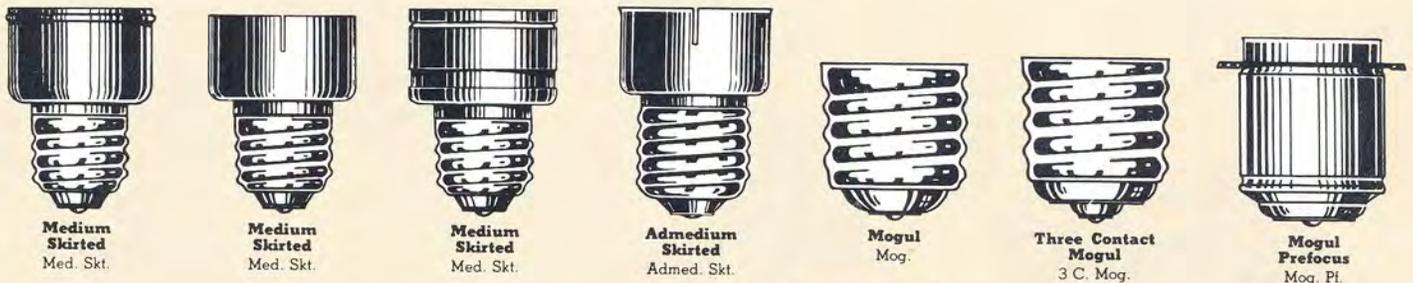

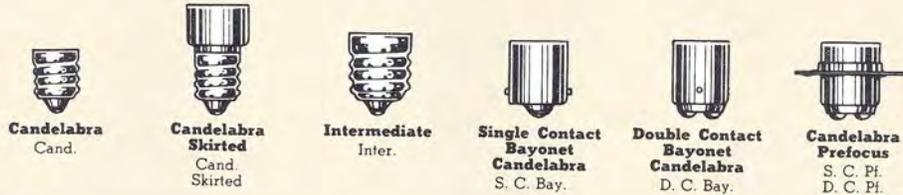

Reduces circulation of hot gases into neck of bulb protecting stem press, stem and socket from excessive temperatures. Used in higher wattage general service lamps and in other types when needed.

### Fuse

Designed to open the circuit if the filament arcs. By reducing sputtering of the metal, cracking of the bulb is prevented. It also protects the circuit and prevents blowing of the line fuses.

# bases

Screw bases in one of several sizes are used on most lamps. Bipost or prefocus bases are used where accurate position of light source with relation to optical elements is important. Mechanical bases are used in some high wattage lamps, flood lights and street series lamps to provide greater strength and better all around performance.

# BULB SHAPES AND SIZES

The general shape of a lamp bulb is indicated by a letter or letter combination which usually is the initials of the word or words describing the shape. Thus the shapes indicated by the letters under the lamps above are:

C — Cone Shape, S — Straight Side, P — Pear Shape, F — Flame Shape, G — Globular, F — Fluorescent, A — Arbitrary designation for the shape in which many lamps are made.

T — Tubular, PS — Pear Shape, straight neck, PAR — Parabolic, R — Reflector, FC — Fluorescent Circline, B — Arbitrary Designation, BT — Combination B and T Shapes.

The over-all length of a lamp is measured from top of bulb to bottom of base and the approximate diameter, measured through the greatest diameter, is given in eighths of an inch. Thus a G-25 bulb is globe shape — twenty-five eighths inches or three and one-eighth inches in diameter.

# BULB FINISHES

FROSTED

DAYLIGHT

SILVERED BOWL

WHITE BOWL

INSIDE FROSTED  
ENAMELED

Q COATED

OUTSIDE  
COATED

ENAMELED

NATURAL  
COLORED

Lamp bulbs have several different finishes which are applied to obtain a desired control of light, to affect the quality of light or to produce desired color of light. Finishes may be clear, frosted, enameled, inside or outside color coated, silvered, colored glass or the latest process "Q" coating — the application of fine particles of silica to the inside of the bulb. Soft glass is generally used but hard glass is used in smaller bulbs when higher wattages are desired and for lamps intended for outdoor use. Finishes are generally indicated by abbreviations such as CL — clear, IF — inside frosted, DCL — daylight clear, DIF — daylight inside frosted, EN — enameled, IC — inside colored, RFL — reflecting, SB — silver bowl, WB — white bowl, NC — natural colored. Typical color abbreviations are AO — amber-orange, B — blue, FT — flament, G — green, R — red, O — orange, Y — yellow, GO — gold, PK — pink, W — white.

*Lamp Ordering Abbreviations* are generally made up of wattage, bulb shape, size in eighths of inch and finish, use or other description.

# G-E FLUORESCENT LAMPS

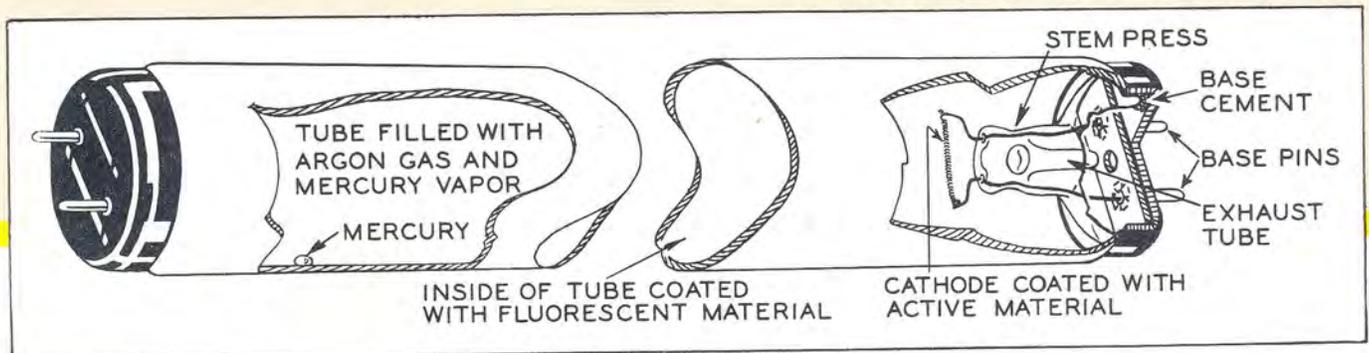

In fluorescent lamps, gas acts as the conductor of electricity and light is produced by electronic activity, as opposed to electrically heating a filament to incandescence to produce light in an incandescent lamp.

A fluorescent lamp is a complex electrical device. For this reason its light output and performance can be greatly affected by the quality and design of materials used to make it, by precautions taken during manufacture, and also by the equipment used for starting and operating the lamp.

In appraising the value of a fluorescent lamp the following factors must be considered in addition to price: Light output; Maintenance of light; Dependability; Uniformity; Color; Life.

## TYPES OF FLUORESCENT LAMPS

1. General Line fluorescent lamps are available in several types:
  - a. Bipin-base lamps for use in fixtures having starters or manual starting switches.
  - b. Bipin-base Rapid-Start lamps for use on Rapid-Start ballasts to get quick starting without starters. These lamps may also be used in fixtures with glow-type starters.
  - c. Recessed base Rapid-Start lamps for higher light output.
  - d. Bipin-base instant-start lamps for fixtures with instant-start ballasts.
2. Slimline fluorescent lamps are instant-start types with single-pin bases.
3. Circline fluorescent lamps have circular shapes and use 4-prong connector-type bases.

## CATHODES

Two cathodes, placed one at each end of the lamp, are the source of electrons by which the current is conducted in a fluorescent lamp. The design and treatment of the cathode has a decided effect on the performance of the lamp.

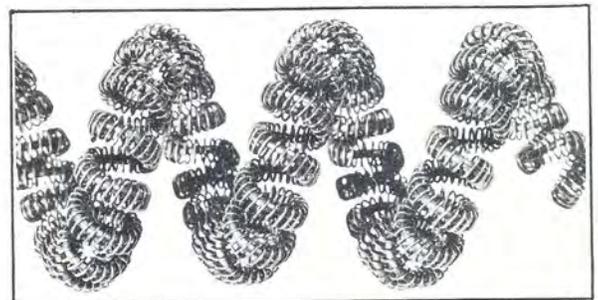

### TRIPLE-COIL TUNGSTEN CATHODES

Used in instant-start single-pin and bipin-base lamps, and also in the Rapid Start Lamps. This is a unique cathode design developed by General Electric, giving improved life performance on Instant-start and Rapid Start ballasts because the cathode holds more emission material and holds it more securely. Too, the fine wire heats up quickly during starting, which also increases life.

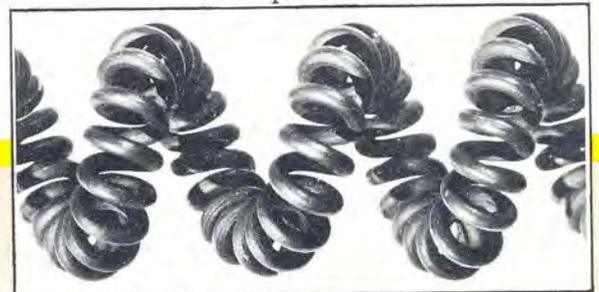

### COILED-COIL TUNGSTEN CATHODES

Used in general line lamps intended for starter service, and also for Trigger-start ballasts.

In manufacture, the coiled tungsten wires shown below are coated with the electron-emitting material.

Triple-Coil

Coiled-Coil

# BALLASTS FOR FLUORESCENT LAMPS

50A/S11N/W

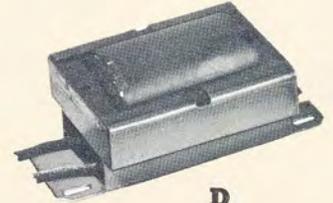

A

B

C

D

Since fluorescent lamps have a negative-resistance characteristic and the lamp voltage decreases as the current increases, the lamp will destroy itself unless the current is limited. This protection is provided by the "ballast" which usually takes the form of a choke coil. The ballast must be designed for the size and type of fluorescent lamp used, as well as for the voltage and frequency of the electrical system.

Following is a representative list of 60-cycle ballasts for use with different sizes of lamps. As an alternative to the ballast listed for use with two 14-watt lamps, lamp number 50A/S11N/W is sometimes used. It is a 60-volt, 1/2-ampere lamp with intermediate base.

## For Lamps with Miniature Bipin Bases. Using Starters

Nominal Lamp Watts	Circuit Voltage	Cat. No.	Case Type
4	4	110-125 89G525	D
6-8	110-125	89G435	D

# G-E FLUORESCENT LAMP OPERATING

There are a number of different methods by which fluorescent lamps may be started and operated. Each method requires the selection of a particular combination of fluorescent lamp and auxiliary equipment. The choice depends upon lamp characteristics, application requirements, and cost versus convenience factors. For example, if lamps are to be operated outdoors in cold weather, only a few types will perform with best results.

There are five principal methods of operation. Some lamps may be operated by only one method; some lamps may be operated by more than one. The following describes these five operating methods and lists the lamp sizes appropriate to each.

## 1. Preheat or Switch Starting (with starters or manual starting switches)

If fluorescent lamp cathodes are preheated before the lamp is started, relatively inexpensive ballasts may be used. Such preheating is readily accomplished by means of manual switches (used in desk lamps and portable lamps) or by automatic starters (where fixtures are controlled from a wall switch). Starters are available in either standard or no-blink types. The latter are obtainable in either the manual reset (Watch Dog) or automatic reset designs and in the range of sizes needed for the different lamps. The "Watch Dog" is recommended in most instances because it eliminates "flashing" or "blinking" at the end of lamp life, saves ballast wear, and lasts much longer.

These are the lamps which may be operated with starters: 4-, 6-, 8-, and 13-watt T-5; 15- and 30-watt T-8; 14-, 15-, 20-, 25-, and 40-watt T-12; 90- and 100-watt T-17.

## 2. Trigger Start (no starters)

This newer method permits operation of some smaller preheat-start fluorescent lamps without starters, yet gives practically instant starting. Although lamp life is a little shorter and thus lamp cost a little higher, maintenance is greatly simplified and convenience of use much improved. No special lamp is required, but the lighting fixture must be equipped with the proper size of Trigger Start ballast. This automatically provides cathode preheat without starters. Trigger-Start ballasts are currently available for 14, 15, 20, and 30-watt General Line fluorescent lamps and for 8" and 12" circline lamps.

## 3. Rapid Start (no starters)

This newest of systems combines the simplicity of Trigger Start with the low cost of conventional switch starting. It requires the use of a Rapid Start lamp which uses special low-loss triple-coiled cathodes to reduce cathode heating losses, and is coated with Dri-Film to assure rapid starting even under adverse conditions. Rapid-Start lamps will give good performance in fixtures employing glow-type starters. The lamps should be used with Rapid Start ballasts designed to automatically provide adequate preheat with low losses. Lamps glow as soon as turned on and come up to uniform full brightness in approximately two seconds.

FS-5	FS-2	FS-20	FS-25	FS-4	FS-4DC	FS-30	FS-12	FS-4AR	FS-40	FS-400	FS-64	FS-850	FS-6	FS-850S
4, 6, 8 Watts	14, 15, 20 Watts	14, 15, 20 Watts	22, 25 Watts	13, 30, 40 Watts	13, 30, 40 Watts	30 Watt	32 Watt	40 Watt	40 Watt	40 Watt	90 or 100 Watt	90 or 100 Watt	90 or 100 Watt	90 or 100 Watt

The function of the starter switch is to complete a separate circuit so a preheat current can flow through the filament cathodes and heat them momentarily; after a few seconds the starter circuit automatically opens and the lamp lights. The design of a starter switch is influenced by the starting and operating voltage of the lamp. Since the range between starting and operating voltages varies for different sizes of lamps, several sizes of switches are necessary. Above are starting switches recommended for each size of lamp.

General Electric Lamp Division's Bulletin LS-101 lists technical data on fluorescent lamps, ballasts, starters, and lampholders.

While lamp and ballast prices are slightly higher, these are offset by elimination of the starter and starter maintenance costs. Rapid-Start lamps are available in the 40-watt T-12 size, 16" circline and in lamps designed for greater current to secure higher light output. They are marked "Rapid Start" for positive identification. The same 16" circline lamp may also be used on switch start circuits.

#### 4. Instant Start (no starters)

Through the use of higher-voltage ballasts, these lamps may be started without preheat. They are equipped with triple-coiled cathodes that afford in general the same long life obtained from the popular sizes of general line switch-start lamps. While they look just like switch-start lamps of the same wattage, instant-start lamps are not electrically interchangeable with them, for the cathode leads are short-circuited inside the lamp base to insure safety in use. Therefore instant-start lamps cannot be preheated in starter-type circuits. Further, general line lamps should not be used on instant-start ballasts or much shorter lamp life will result.

Instant-start lamps are available in 40-watt T-12 and 40-watt T-17 sizes. They are also available, on special order, in the 30-watt T-8 size.

#### 5. Slimline (instant start without starters)

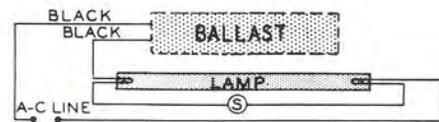

Slimline lamps combine all the advantages of the instant-start lamp with much greater convenience in handling and easier maintenance. The lamps are equipped with extra-strong single-pin bases that fit easily and solidly in rugged push-pull sockets. This combination makes lamp installation fast and easy.

In the longer eight foot sizes, slimlines are the most efficient lamps made. In addition to increased efficiency, the longer length reduces the number of lamps and fixtures required in a given installation. This, together with the elimination of starters, reduces the amount of maintenance required in a fluorescent lighting system.

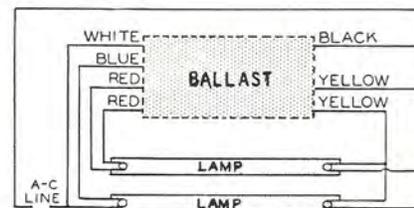

These advantages, together with the long trouble-free life offered by G-E slimline lamps assure continuing growth in popularity.

Slimline fluorescent are available in 42" and 64" lengths in the T-6 bulb size, in 72" and 96" lengths in T-8, and in 48", 72" and 96" lengths in the most popular T-12 diameter.

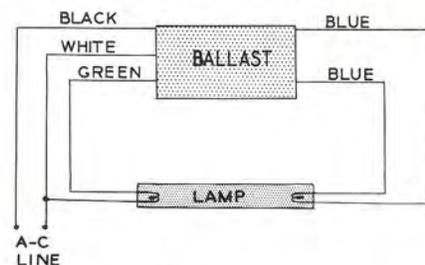

## WIRING DIAGRAMS

2. Trigger Start (No Starters)

3. Rapid Start (no starters)

4. Instant Start (no starters)

5. Slimline (instant start without starters)

# G-E FLUORESCENT LAMP COLORS

G-E Fluorescent Lamps are available in a range of strong colors and in several different "whites." The saturated colors — red, pink, gold, green and blue — are used for decorative effects while the whites serve for both decorative and general lighting purposes. All fluorescent lamps except gold and red are white when unlighted. Different phosphors produce the different colors when lamps are lighted.

White fluorescent lamps are designed to combine three elements important in lighting effects — (1) efficiency — most light per dollar; (2) color-rendering properties — the ability to bring out the beauty of colored materials and objects and (3) "Whiteness" — their appearance in relation to either natural outdoor daylight or the traditional artificial illumination such as filament lamps.

The choice among fluorescent "whites" always involves compromise among these three elements. Obtaining best color rendering properties necessitates reduction in efficiency. Choice of whiteness affects both efficiency and color rendering properties. The descriptions below outline the effects obtained from the most popular whites.

Standard Cool White combines high efficiency with reasonably good color rendition. It is the most widely used fluorescent lamp color in factories, offices and schools. It blends well with natural daylight.

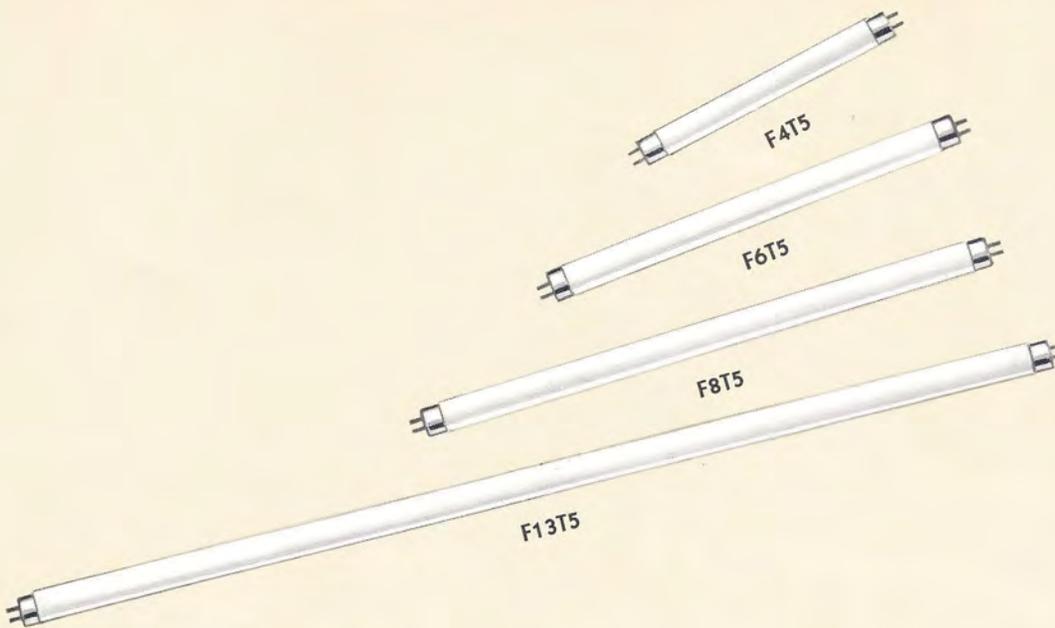

Standard Warm White provides the highest efficiency in white fluorescent lamps, it emphasizes orange, yellow and yellow-green at the expense of other colors. Generally used where highest efficiency is more important than color rendition.

De Luxe Cool White most closely simulates the appearance and color-rendering properties of natural daylight. It is widely used in stores such as supermarkets, florists, men's wear shops and other places where excellent color rendition of natural daylight is needed. Also used in factory and office installations where best appearance of colors is important.

De Luxe Warm White simulates the warm friendly effects of filament lighting in both "whiteness" and color rendering. Usually first choice in residence, restaurants, beauty parlors, department stores, bakeries and other places where "homelike" lighting affects are wanted.

Daylight, Soft White, White, are still available for replacement purposes in existing installations and for new installations where their appearance or color-rendering properties are particularly suitable.

# G-E FLUORESCENT LAMPS

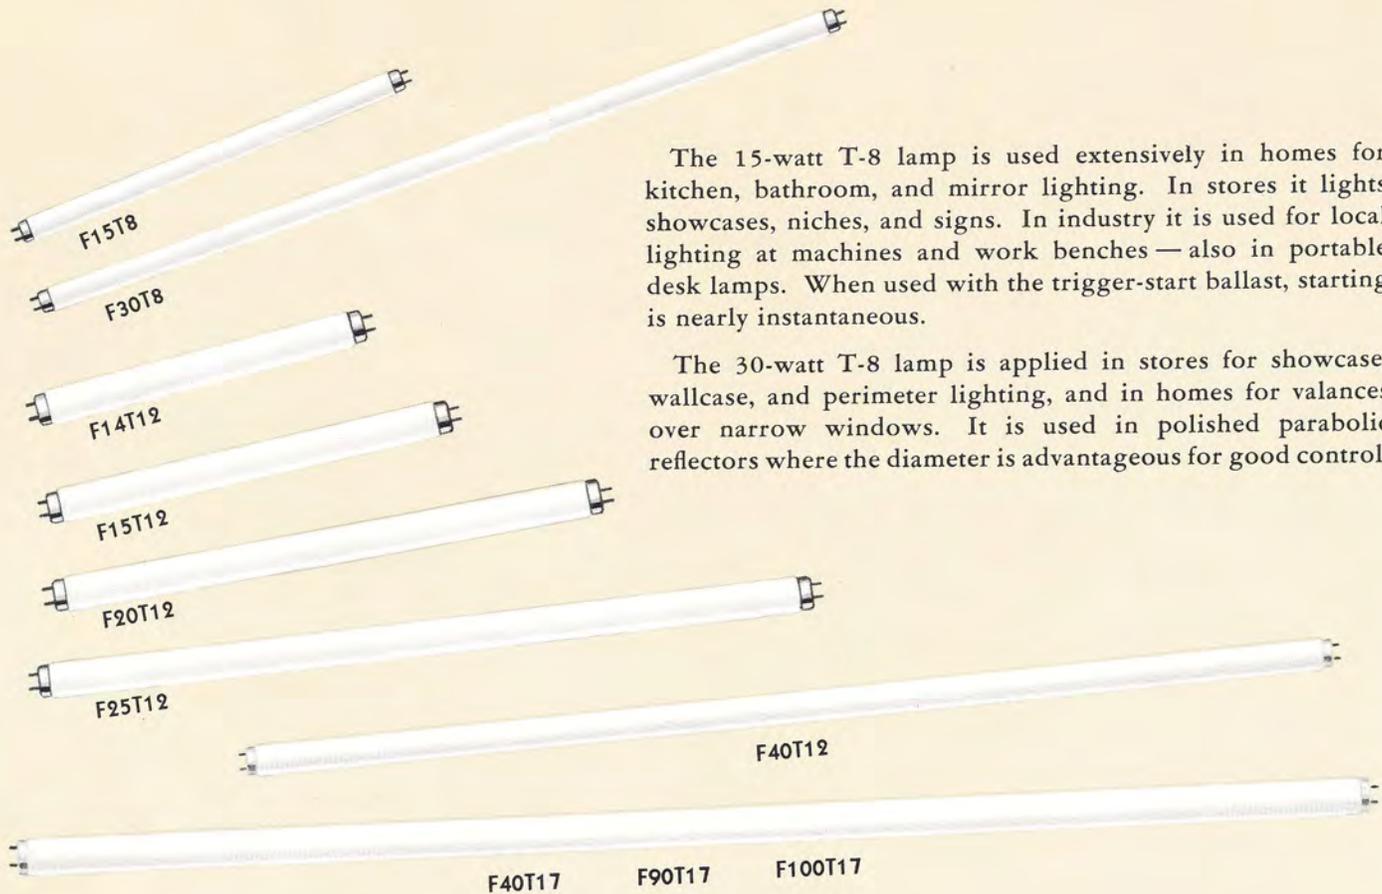

The 4-, 6-, 8-, and 13-watt T-5 lamps are useful where space for lamps is limited and where the inherent cool light and color quality of fluorescent is desired. They are applied in niches, showcases, and shelving in stores. They enhance the function and appearance of miniature displays, signs and models. They supply light locally for machine work, fine assembly, inspection, and other supplementary lighting applications. They are built into business machines and similar devices for increased visibility of dials, scales, and keyboards.

<sup>②</sup> Approximate initial lumens after 100 hours operation.

# G-E FLUORESCENT LAMPS

The 15-watt T-8 lamp is used extensively in homes for kitchen, bathroom, and mirror lighting. In stores it lights showcases, niches, and signs. In industry it is used for local lighting at machines and work benches — also in portable desk lamps. When used with the trigger-start ballast, starting is nearly instantaneous.

The 30-watt T-8 lamp is applied in stores for showcase, wallcase, and perimeter lighting, and in homes for valances over narrow windows. It is used in polished parabolic reflectors where the diameter is advantageous for good control.

<sup>①</sup> Life under specified test conditions with lamps turned off and restarted no oftener than once every 3 burning hours.

<sup>②</sup> Approximate initial lumens after 100 hours operation.

The 14-watt T-12 lamp is used for supplementary lighting in stores and industry. It is applied where space does not permit use of the longer 15-watt lamp. It has been employed in portable lamps using a low-wattage filament lamp for a ballast.

The 15-watt T-12 lamp has a lower bulb-brightness than the 15T8 lamp for about the same amount of light. It is preferred over the T-8 lamp if used without shielding as is sometimes done for bathroom mirror lighting and some other applications. Its many uses paralleled those of the 15-watt T-8.

The 20-watt T-12 lamp is one of the most widely used fluorescent lamps. It is employed in home fixtures for lighting in kitchens, bathrooms, basements, and recreation rooms. It is used in window valances and under shelving and cupboards for decorative and utilitarian lighting. It may be used to light closets, washrooms and small areas. It is also employed for supplementary lighting in offices and factories. In stores it lights fitting mirrors, niches, and wallcase displays. It may be operated by trigger-start ballasts.

The 25-watt T-12 33-inch lamp is the longest T-12 lamp which can be operated from 120 volts a-c with a simple choke ballast. It is principally used in homes, either in general lighting fixtures or built into window valances and kitchen work spaces.

<sup>①</sup> Life under specified test conditions with lamps turned off and restarted no oftener than once every 3 burning hours.

<sup>②</sup> Approximate initial lumens after 100 hours operation.

<sup>③</sup> D. C. Operation.

All G-E Fluorescent lamps should be used only with auxiliary equipment designed to produce proper electrical values. Unless otherwise noted, ratings apply to operation in a-c circuits. Lamps may be burned in any position.

# G-E FLUORESCENT LAMPS

The 40-watt T-12 preheat lamp is used extensively for general lighting in every field of application. It is employed in strips or channels for lighting valances in homes and stores, for display fixtures, show windows, and hundreds of other services. Specially designed low temperature lamps are recommended for use in temperatures from 50°F to 0°F. Also available are instant-start types which reduce maintenance and insure more reliable starting when used outdoors in cold weather.

The 40-watt T-17 lamp has a comparatively low surface brightness. It is used for high-quality lighting installations in schools and

offices and for special industry applications where it is important to minimize direct and reflected glare.

The 90-watt and 100-watt T-17 lamps produce more light per foot than any others in the line. The light output of the 90-watt Cool White lamp is 5150 lumens, the light output of the 100-watt is 4850 lumens. The 90-watt lamp is used in industry for general lighting and also in offices, stores, and show windows. The 100-watt lamp maintains its light output well in cold surroundings and is used for outdoor applications (with thermal starters) or in areas with low ambient temperature.

The life and light output ratings of fluorescent lamps are based on their use with ballasts providing proper operating characteristics. Ballasts that do not provide proper electrical values may substantially reduce either lamp life or light output, or both.

Ballasts certified as built to the specifications adopted by the Certified Ballast Manufacturers (CBM) do provide values that meet or exceed minimum requirements. This certification assures the user, without individual testing, that lamps will operate at values close to their ratings.

**Lumen Output** and efficiency values apply at the end of 100 hours operation, where measured at 80°F ambient temperature and under specified test conditions.

**Lamp Life** — All life ratings are based on three burning hours per start. Less frequent starting tends to increase lamp life. When lamps are operated at six or twelve burning hours per start, average life is increased by 25% or 60% respectively. For continuous burning, average life is 2½ times the rated value. Since light output depreciates steadily as lamps are burned, greatest lighting value usually results when lamps are replaced before they reach their average life.

(1) Life under specified test conditions with lamps turned off and restarted no oftener than once every 3 burning hours.

(2) Approximate initial lumens after 100 hours operation.  
 (3) The pins of these lamps are short circuited inside the end caps and lamp will not operate on preheat ballast circuits.

# G-E RAPID START FLUORESCENT LAMPS

Rapid Start 40-watt T-12 fluorescent lamps simplify lighting maintenance for the user and give, in effect, instant starting at costs comparable to those of the 40-watt preheat lamp. Starters are eliminated from the electrical circuit. This is accomplished with a cathode design in the lamp somewhat different from that of the preheat lamp and with a ballast having low-voltage windings which apply heating to the cathodes at starting and during operation. Rated lamp life and light output are the same as for the preheat.

It is desirable to operate the Rapid Start lamps

close to metal which runs the length of the lamp. The fixture or wiring channel which holds the lamp will serve this purpose.

It is expected that the Rapid Start lamp will be used instead of the preheat type in most new lighting installations where 40-watt fluorescent lamps are chosen.

The 100-watt Rapid Start 72T12 lamp is especially designed for street lighting and other outdoor services.

① This lamp is designed and rated for operation in supplementary cathode preheat circuits, for which specifications are available from the lamp manufacturers.

② 40-watt rapid start lamps may be used in Starter-operated fixtures designed for 40-watt general line lamps. When used, their starting and performance will be similar to that of general line lamps. They will deliver rated life and light output, and will operate at rated watts.

③ Life under specified test conditions with lamps turned off and re-started no oftener than once every 10 burning hours.

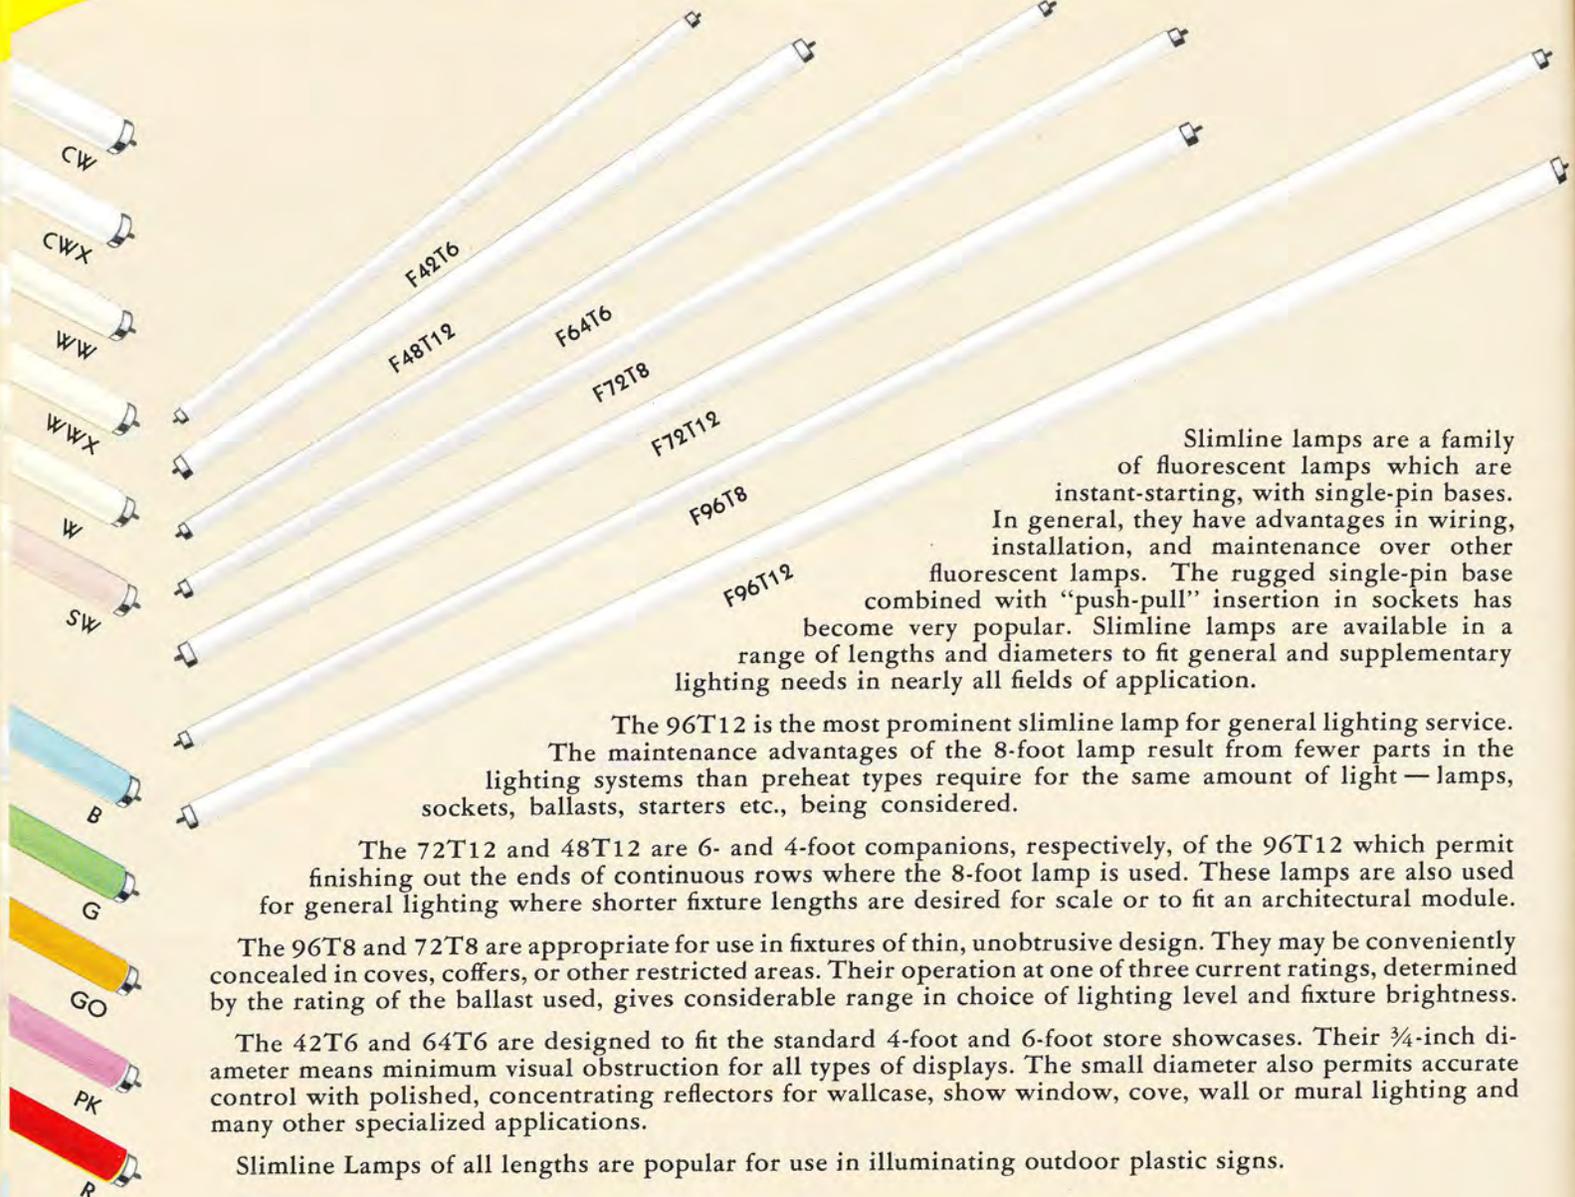

# G-E RF FLUORESCENT LAMPS

RF lamps have special bases and are available for replacement in RF equipment.

# G-E SLIMLINE FLUORESCENT LAMPS

Slimline lamps are a family of fluorescent lamps which are instant-starting, with single-pin bases. In general, they have advantages in wiring, installation, and maintenance over other fluorescent lamps. The rugged single-pin base combined with "push-pull" insertion in sockets has become very popular. Slimline lamps are available in a range of lengths and diameters to fit general and supplementary lighting needs in nearly all fields of application.

The 96T12 is the most prominent slimline lamp for general lighting service. The maintenance advantages of the 8-foot lamp result from fewer parts in the lighting systems than preheat types require for the same amount of light — lamps, sockets, ballasts, starters etc., being considered.

The 72T12 and 48T12 are 6- and 4-foot companions, respectively, of the 96T12 which permit finishing out the ends of continuous rows where the 8-foot lamp is used. These lamps are also used for general lighting where shorter fixture lengths are desired for scale or to fit an architectural module.

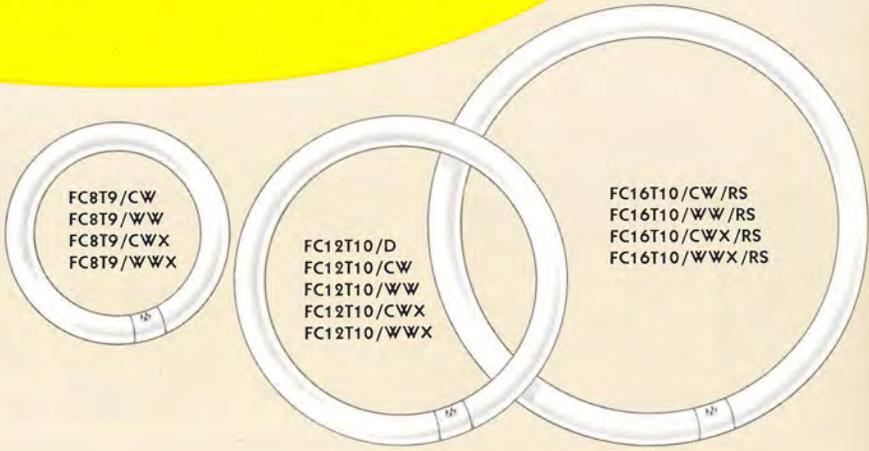

The 96T8 and 72T8 are appropriate for use in fixtures of thin, unobtrusive design. They may be conveniently concealed in coves, coffers, or other restricted areas. Their operation at one of three current ratings, determined by the rating of the ballast used, gives considerable range in choice of lighting level and fixture brightness.

The 42T6 and 64T6 are designed to fit the standard 4-foot and 6-foot store showcases. Their 3/4-inch diameter means minimum visual obstruction for all types of displays. The small diameter also permits accurate control with polished, concentrating reflectors for wallcase, show window, cove, wall or mural lighting and many other specialized applications.

Slimline Lamps of all lengths are popular for use in illuminating outdoor plastic signs.

# G-E CIRCLINE FLUORESCENT LAMPS

Circline fluorescent lamps are now available in three diameters. They are widely used in home lighting fixtures and portable lamps. They are also used for decorative lighting in restaurants, theatres, lobbies, lounges, and other commercial areas. They are adapted for some inspection processes in industry. The 8- and 12-inch diameter lamps may be operated on trigger-start ballasts. The 16-inch diameter lamp is designed for rapid-start operation.

\* This lamp is designed and rated for operation in supplementary cathode preheat circuits, for which specifications are available from the lamp manufacturer. It will operate in conventional starter type circuits but is not expected to attain full rated performance. It is recommended for use only with single lamp ballasts or two lamp lead-lag ballasts and with fixtures and circuits properly grounded.

(1) Life under specified test conditions with lamps turned off and restarted no oftener than once every 3 burning hours.

(2) Approximate initial lumens after 100 hours operation

# G-E INSIDE FROSTED LAMPS

These lamps, which are recommended for most general lighting applications, have an inside frosting which diffuses the light, eliminates striations and helps soften shadows. The outer bulb surfaces are smooth, easy to clean, and the frosting absorbs very little light.

The range of wattages and lumen values is comprehensive. These lamps, combined with the many types of good equipments now available, provide tools to meet the many and diverse needs for residential, commercial and industrial lighting. There are small units for local lighting and low mounting heights and larger ones for higher mounting and wider spacing. The right lamp in combination with the right reflector is

essential for effective and comfortable lighting.

The standard 150-watt lamp is now made in the A-23 bulb, replacing the former PS-25 bulb.

The short bulb, medium screw, 250-watt lamp is made for use in indirect torchieres and similar portables.

Three lamps — in 500, 750, and 1000 watts — are listed with tubular bulbs of heat-resistant glass and medium bipost bases. These lamps make possible the design of commercial and industrial lighting equipments smaller in size than would be necessary if designed for equal wattages in standard PS bulbs.

# G-E "GA" LAMPS

50GA

100GA

The GA lamp — "The lamp with the built-in shade" — is a complete lighting device in itself and is ready to use in open-type single and cluster ceiling fixtures now using bare lamps. Designed for base-up burning, the lamp has an enameled bowl of a warm pleasing tint for homes and similar interiors which directs approximately 2/3 of the light upward and 1/3 downward.

The 50-watt GA lamp is especially appropriate for two, three, four and five light fixtures. The 100-watt size is recommended for single socket fixtures. The graceful contours and un-

usual style of these lamps appeal to the decorative tastes of many users such as homes, hotels, clubs, restaurants and public buildings.

# G-E YELLOW LAMPS

25A/Y

40A/Y

100A21/61Y

60A/Y

150PS25/Y

G-E Enameled Yellow Lamps, excellent for decorative lighting, are designed primarily for outdoor lighting during the season of night-flying insects. They have less attraction for insects than lamps of other colors.

Yellow lamps are used on open porches, outdoor recreation areas, filling stations, camps, roadside stands, carnivals — any place where people enjoy outdoor activities under lights.

<sup>①</sup> Design volts 120.

# G-E "Q" COATED LAMPS

These white lamps have a fine coating of silica on the inside of the bulb. This "Q" coating gives a high degree of diffusion which softens shadows and reduces shiny reflection. The light output of white lamps is approximately the same as that of inside frosted lamps of the same wattage. Since bulb blackening is not apparent through this new diffuse coating the lamps appear clean and white throughout life. The 50/150M/W lamp is for base down burning in floor, table or wall lamps.

The 60A/W and 100A/W lamps are especially suitable for use in residential fixtures and portable lamps.

The 150R/W and 50/150R/W have a special bulb shape and diffusing coatings with a variation in density which produces a controlled distribution of light when used in portable floor, table and wall lamps without diffusing bowls.

# G-E SILVERED AND SEMI-SILVERED BOWL

60A/SB

100A/1SBIF

100A/SB

150/SB

200/SBIF

200/SBIF/1

300MS/SBIF

300/SBIF

300/SBIF/1

Silvered bowl lamps have long been popular for efficient indirect lighting of schools, offices, homes and commercial buildings. They are also used in direct lighting equipment such as dome-type reflectors, spotlight and floodlight reflectors, and in recent designs of large-area louvered equipment. The mirrored reflecting surface is sealed against dust and dirt. The opaque bowl shields the glaring lamp filament from view; this in turn allows fixture design in which the lamp bowl is exposed so that lamp replacement is simple and direct.

Semi-silvered bowl lamps have a small open area at the bottom to provide direct downlighting emphasis over counter or display areas in stores.

# LAMPS

500/SBIF

500/SBIF/1

750/SBIF  
1000/SBIF

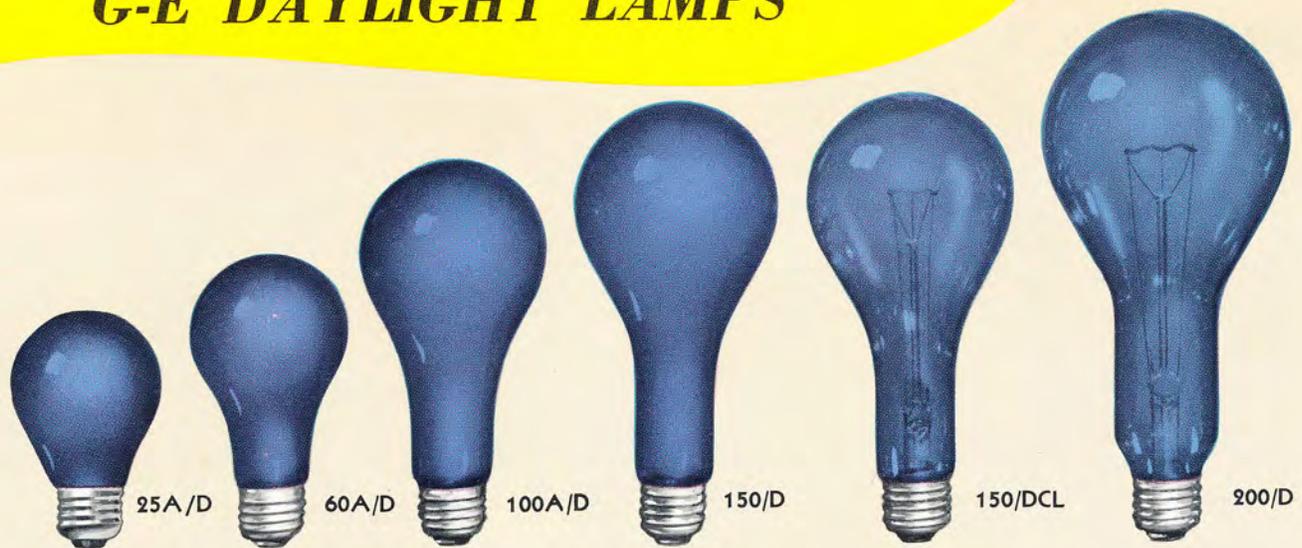

The process by which G-E Silvered Bowl lamps are silvered assures a high quality reflecting surface which does not dull, tarnish or deteriorate throughout the life of the lamp. The bulb is first chemically cleaned and sensitized to receive a coating of pure silver. A protective copper layer is then electrolytically deposited over the silver to prevent oxidation due to filament heat. To this is added, further, a surface of overlapping aluminum flakes. These metallic deposits, approximately 1/5000th of an inch in thickness, are firmly sealed to the glass to create a highly efficient, mirror-like reflector.

Silvered Bowl and Semi-Silvered Bowl lamps should be burned base up. Sizes from 150-watt and up should be burned in porcelain sockets.

<sup>①</sup> For use only in porcelain sockets and in fixtures so designed that the temperatures of the lamp and fixture do not exceed limits for satisfactory operation.

# G-E DAYLIGHT LAMPS

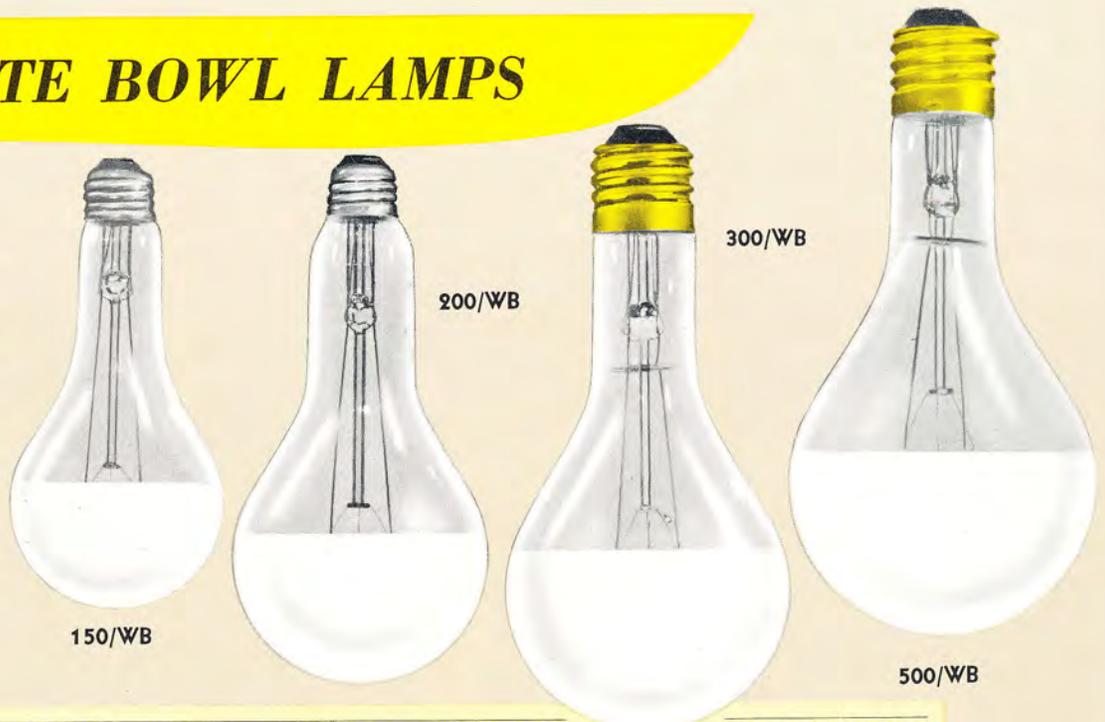

Daylight lamps give a somewhat "whiter" color quality of light than regular filament lamps. The use of either frosted or clear daylight lamps is usually simply a matter of choice.

However, the frosting diffuses light and helps reduce glare and sharp shadows. The clear lamps give more sparkle and shine to merchandise, such as jewelry.

# G-E WHITE BOWL LAMPS

White Bowl lamps are designed principally for use in open type direct lighting fixtures. They have a white enamel coating on the inside of the bowl which redirects about 80% of the light upward. About 20% of the light is diffused downward through the bowl. This redirection and diffusion improves the quality of illumination by softening shadows and reducing glare.

# G-E THREE-LITE LAMPS

Three-lite lamps with their two filaments provide three levels of lighting. Each filament is of a different wattage and may be lighted individually or in combination with the other.

The lower wattage is for decorative or casual effects. The combined wattage of the two filaments is for use where seeing requirements are important.

The 150-watt and 300-watt sizes are particularly applicable to floor, table and wall lamps having diffusing bowls. However, the 50/150R/W is especially for use in portable lamps without diffusing bowls because of its shape and special white diffusing coating. The 30/100 finds much use in vanity and dresser lamps.

Three-lite lamps are designed for base down operation with the exception of the mogul base 50/150-watt size.

Clear lamps are suitable for general lighting where the bright filaments are modified by diffusing equipments or are adequately shielded by reflectors.

Gala lighting for amusement and festive areas can be obtained with clear, low-wattage lamps, unshielded. Or the lamps may be partially shielded by prisms, beads, and spangles.

Some reflecting or refracting units, designed for defined beam patterns, need clear lamps for a control more accurate than is obtainable with frosted lamps.

Available are 200-watt lamps, normally medium base, with mogul bases; and two 300-watt lamps, normally mogul base, with medium screw bases.

Two lamps, in wattages of 1000 and 1500, are made with bulbs of heat-resistant glass. They are intended for use in open floodlights for lighting outdoor sports, gas stations and parking areas.

General Electric projector and reflector lamps are self-contained spotlighting and floodlighting units. They are widely used in commercial, industrial, and home applications. Principal advantages are compactness, convenience, and elimination of reflector deterioration due to dirt.

PAR-38 projector lamps may be used outdoors in exposed locations; other projector lamps require shielding from moisture. External devices such as color roundels, louvers, and shields can be clipped directly to the PAR-38 bulbs. The PAR-38 spots and floods with side-prong base are 1" shorter in over-all length than the corresponding screw-base lamps. These side-prong lamps are designed to be supported by the bulb rim or metal shell of base and used with a heat resistant flexible connector. This offers ease of aiming along with minimum space requirements, for such applications as store and show-window lighting.

Heat-resistant glass although more expensive, allows higher wattage in the same bulb size and will withstand greater thermal shocks such as from moisture on the hot bulb. A noteworthy General Electric development has provided a method for applying light frost *uniformly* to bulbs of heat-resistant glass.

The R-52 lamps, in 500- and 750-watts, are especially designed for high-bay lighting in industrial plants. The contour of the silvered

portion of the bulb, and the filament position, are designed for favorable light distribution and shielding. Substantially even illumination results when spacing between units does not exceed mounting height. These lamps are widely used in plants where there is rapid collection of dirt on lighting equipment. They are of special advantage where lighting units can be reached for maintenance only at high cost, or where production may be interrupted by tying up a crane. Typical applications are in foundries, railroad car shops, steel mills, and welding shops. Almost no dirt collects on the bottom face of the R-52, where the light is emitted. The bulb should be protected from moisture.

Lamp No's. 150R/SP, 150R/FL, 300R/SP, 300R/FL, should not be used in equipment when the base temperature will exceed 500°F.

# G-E SIGN AND DECORATIVE LAMPS

These lamps are used for outdoor signs, Christmas and other decorations, carnivals, fairs, and festoon lighting as well as many

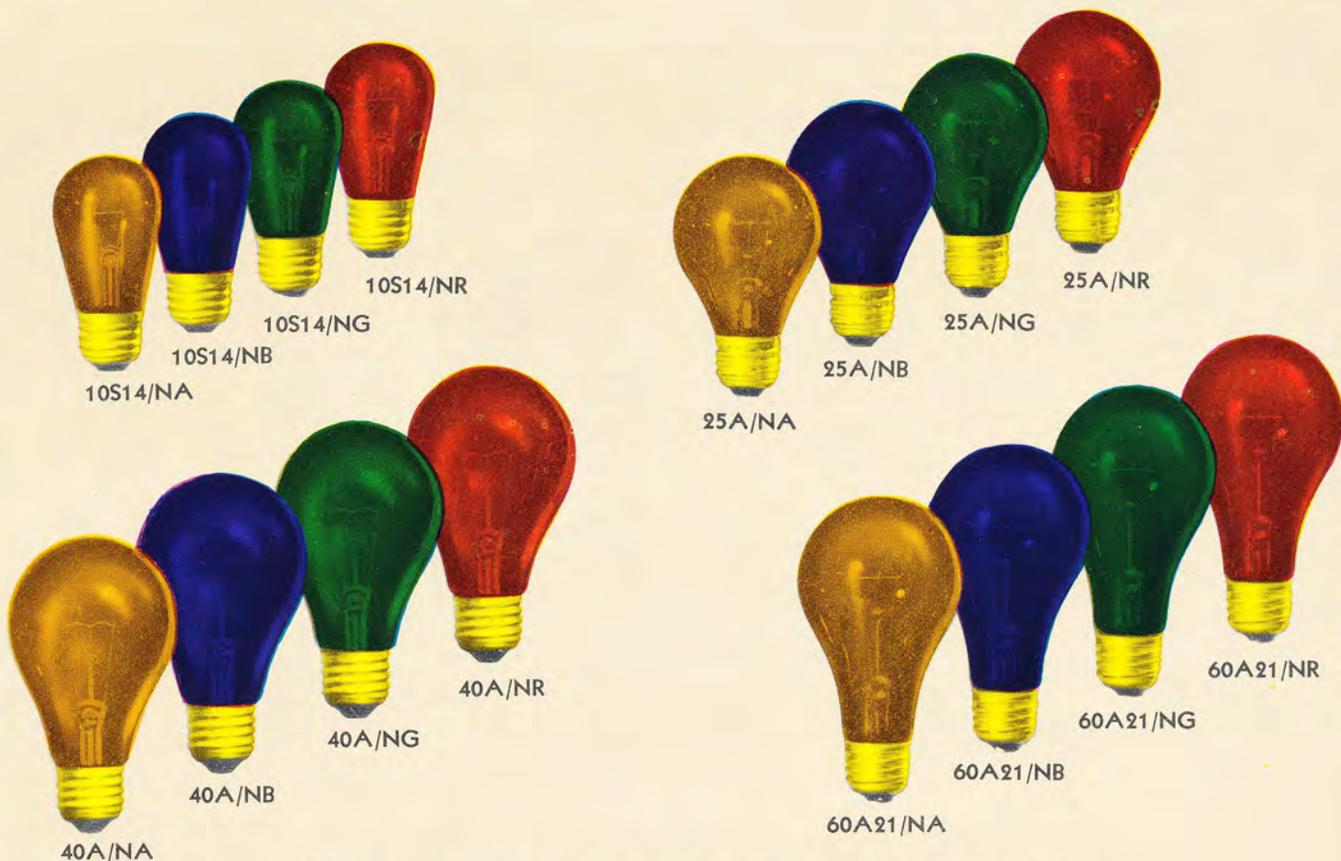

interior applications. The color is a fired-on, glass-like material that will not scratch, chip, peel, or come off when exposed to the weather. Colors are clear and bright, and they are designed for maximum appeal both in combination and alone.

# G-E NATURAL COLORED LAMPS

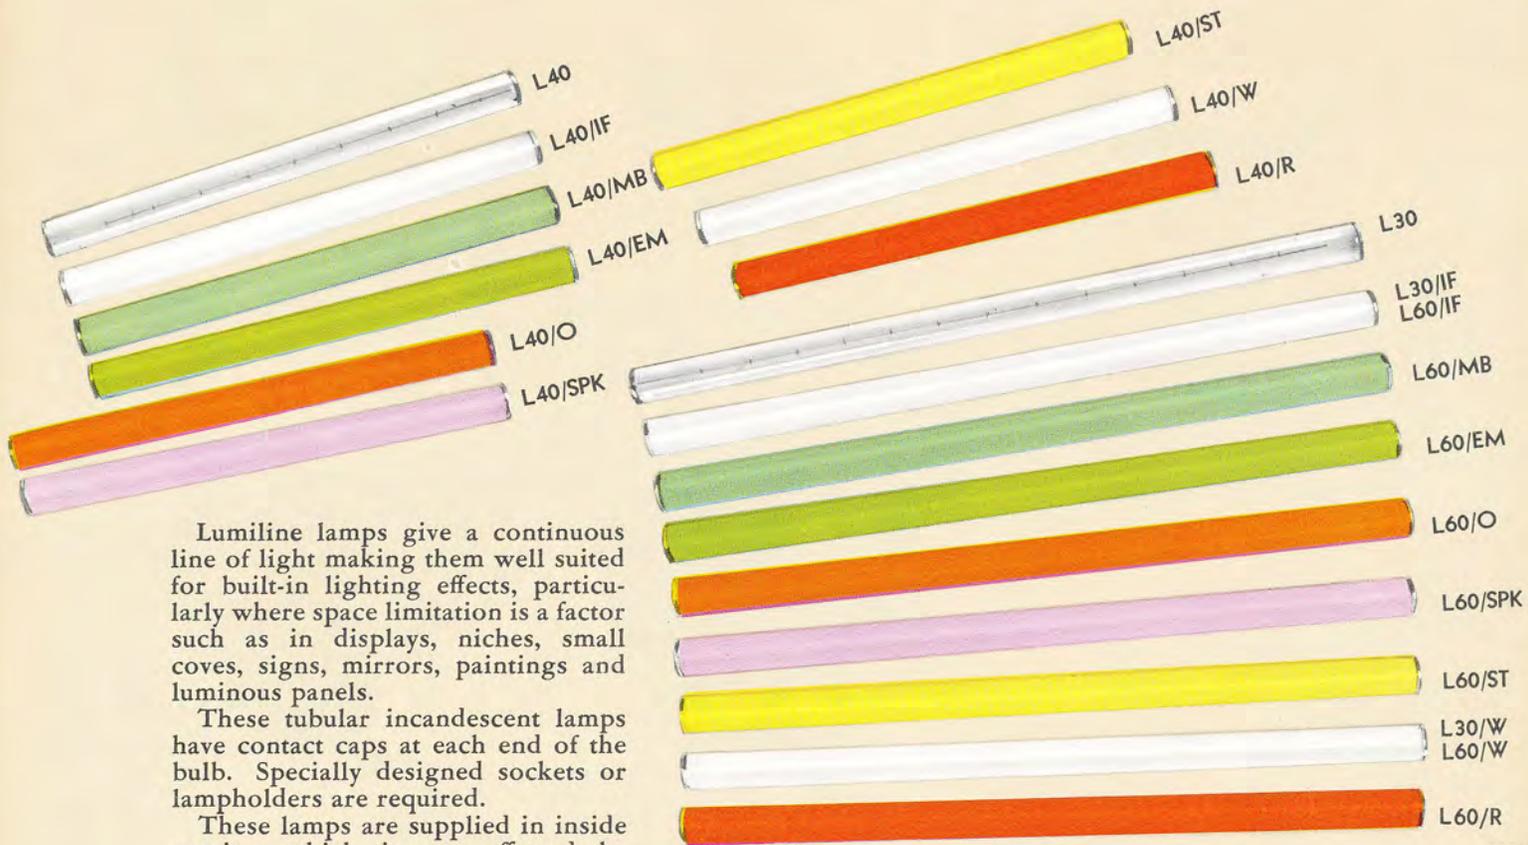

Lamps with natural colored glass bulbs are recommended for use where it is important to achieve color with a non-diffusing bulb. They are used more for specialized applications than for ordinary sign and decorative color effects.

These lamps are primarily for indoor applications. If the 60-watt gas filled lamps are used outdoors it is best to protect them from moisture.

Natural ruby and natural amber lamps are regularly furnished in the lighter shade. Dark ruby and dark amber lamps used in photographic work will be furnished only when definitely specified, at the same price.

# G-E LUMILINE LAMPS

Lumiline lamps give a continuous line of light making them well suited for built-in lighting effects, particularly where space limitation is a factor such as in displays, niches, small coves, signs, mirrors, paintings and luminous panels.

These tubular incandescent lamps have contact caps at each end of the bulb. Specially designed sockets or lampholders are required.

These lamps are supplied in inside coating which is not affected by moisture and weather conditions. However, the lamps are generally considered for interior use.

# G-E REFLECTOR COLOR LAMPS

150R/R

150R/PK

150R/G

150R/Y

150R/BW

150R/B

G-E reflector color lamps provide dramatic display and lighting effects. The four basic colors, red, green, yellow and blue are ideal for lighting backgrounds to accentuate merchandise on display.

Pink and blue-white provide general illumination as well as color effects. Pink is used for warmth and blue-white for cool highlights.

Intermediate hues are obtained by mixing ap-

propriate pairs of the basic colors in various combinations.

Reflector color lamps fit in regular sockets and holders. The silvered reflector is built right into the lamps, — cannot get dirty or tarnish. Color is fused onto the glass so it cannot fade, chip or peel.

When used outdoors these lamps should be sheltered or housed in suitable fixtures to protect them from rain or snow.

# G-E STREET RAILWAY LAMPS

Headlight lamps are designed for operation in series with four lamps of corresponding wattage and voltage used elsewhere in the car.

Car Lighting, 5-in-series, lamps are of the vacuum type. The 36-watt and 56-watt lamps provide more satisfactory performance when operated in the vertical base-up position.

The 30-volt cut-out lamps are of the gas-filled type

and are provided with a cut-out feature which short circuits the individual lamp upon burnout.

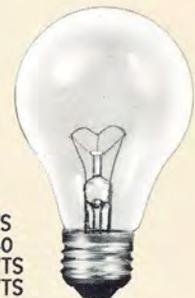

Shop and Yard Lighting—Arc-resisting lamps are provided with a feature built into the stem of the lamp to minimize the tendency to arc when a lamp in the 5-in-series circuit burns out They are chiefly used in the lighting of shops and yards.

# G-E TRAFFIC SIGNAL LAMPS

The traffic-signal beam candlepowers recommended by the Institute of Traffic Engineers are based on the light output of the standard 60-watt traffic signal lamp. The 67-watt lamp is equivalent in light output to the 60-watt lamp and has longer life for group replacement which usually reduces maintenance expense and signal outages due to lamp burnouts.

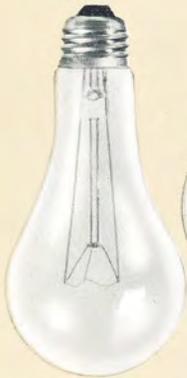

The 100-watt and 111-watt lamps are used where there is high background brightness or where a special hazard may call for a signal having unusually high attention-value.

Filament forms and support constructions of lamps in light face type are not exactly as illustrated but differ only slightly.

Use of multiple lamps in street lighting is steadily increasing. A multiple street lamp having a certain value of nominal lumens is designed to deliver the same average light output throughout life as the series lamp of corresponding lumen rating.

Street series lamps, operated on constant-current series circuits, have a slow increase in wattage and filament temperature throughout life. Hence the light output is maintained throughout life at a high percentage of initial value.

Current variations affect sharply the performance of street series lamps. The current in street series circuits should therefore be adjusted as nearly as possible to rated value.

The 3000-hour street lighting lamps are intended for group replacement twice a year. The "standard" (2000-hour series and 1500-hour multiple) street lighting lamps are widely used for group replacement three times a year. Reference: General Electric Lamp Division Bulletin LS-106A, "Analysis of Street Lighting Costs as Affected by Group Replacement."

Airway and airport lamps and airplane landing lamps are generally used in projection type of equipment. In G-E Aviation Lamps for these applications the filaments are accurately positioned to aid in providing the desired beam patterns.

Code Beacon Lamps are frequently used as obstruction markers on tall structures. The 500PS40/45 rated at 1000 hours is generally used where lamp replacement is easy. The 3000-hour 620PS40P allows the economy of group replacement especially where maintenance is difficult. The 620PS40/1P has a "hard glass" bulb and is used in units where water leakage would cause breakage of the "soft glass" bulbs such as used on the other two lamps.

Present practice in Airport Approach Lighting uses "line-shaped" fixtures having between 5 and 10 PAR-56 sealed beam type of lamps mounted in a row. Whatever the length of fixture or pattern of fixture arrangement, the three PAR-56

lamps listed are the basic light sources.

Some Airplane Landing Lights use lamps in 10-inch reflectors located in the leading edge of the wing. Sealed beam type of landing lamps are commonly used on newer aircraft. They are listed in General Electric Miniature Lamp Schedules and Catalogs.

Low intensity, semi-flush Airport-Runway Marker lights, about 2 inches high, use A-21 lamps. Medium intensity elevated lights, about 2 feet high, use T-10 lamps. Higher intensity elevated lights, on runways where instrument landings are made, use 6.6A/T14P lamps.

# G-E TRAIN AND LOCOMOTIVE LAMPS

## TRAIN LIGHTING

Train lighting lamps are specially designed to withstand the intense vibrations and shocks encountered in this service. In general they are available for operation on either 30-, 34- or 60-volt direct current circuits. To insure satisfactory life, voltage regulating devices must be kept adjusted to the proper voltage so that the voltage at the lamp socket corresponds with that shown on the lamp marking.

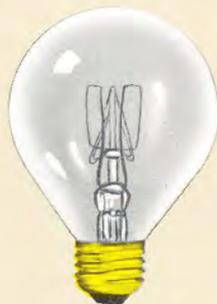

## LOCOMOTIVE HEADLIGHTING

The 200 PAR lamp is of the sealed beam type of the all-glass construction incorporating the filament, reflector and coverglass in a single unit. It is customary to operate one lamp for switching locomotives and two for road locomotives. When applied to Diesel-electric locomotives, fixed resistors are installed in the circuit to reduce the line voltage to 30 volts.

Where separate reflectors and lamps are used, the 100A21/3, 32-volt lamp is recommended

for switching service. In similar equipment used on road locomotives the 250-watt P-25 lamp is recommended.

#### LOCOMOTIVE CAB LIGHTING

The 34-volt lamps are intended for use in steam locomotive cabs. The 60-volt lamps are for Diesel-electric locomotives equipped with voltage regulators, whereas the 75-volt lamps

are for use in Diesel-electric locomotives not thus equipped.

The 6S6 lamps are used either as indicators or for instrument lighting. The 25- and 50-watt lamps are for use in the engine compartment as well as for cab lighting.

The 30-watt S-11 lamp is mainly a marker or classification lamp, operated in series with a resistance on Diesel-electric locomotives.

① Unsatisfactory lamp operation is likely to occur in burning positions between horizontal and base up, particularly between 45° from base up and base up.

# G-E LOW VOLTAGE LAMPS

(6-Volt, 12-Volt And 30-Volt Lamps)

6S6

5S14

15A

25A

50A21

100A

6- and 12-volt lamps are used on battery-generator outfits, for automobiles, boats, airplanes and places where electric service is not available.

30-volt lamps are for operation on battery-generator sets such as used in rural areas and are the

same as used in 30-volt train lighting systems.

Low voltage lamps, because of their higher current for a given wattage, are more rugged, and in general more efficient.

# G-E MARINE LAMPS

General Electric marine lamps are especially designed to meet the exacting requirements of marine services. Included are lamps for running lights, searchlights, signal lights, and for divers' use underwater. Dependable operation is of vital importance. The needs of interior illumination aboard ship are well met with General Electric general service lamps.

# G-E HIGH VOLTAGE LAMPS (230-250 Volts) FOR GENERAL LIGHTING SERVICE

These lamps, which are somewhat less rugged and less efficient than 115-125-volt lamps, are made available for use in the relatively few locations where only the higher voltage is available.

The filaments in high voltage lamps are thinner and longer than those in standard voltage lamps. This results in a lower efficiency as compared with standard voltage lamps.

The 750 watt R-52 lamp is for base up burning. Should be shielded against moisture falling on the bulb.

Due to lack of space only clear lamps are illustrated.

Lamps intended for use under conditions where they may be subjected to vibration or shock have special features such as filament wire, mount construction or filament windings, which assure their efficient operation in service.

The 15T7 lamps are for use in sewing machines and other appliances when vibration is a factor. The 25T8 lamps for vacuum cleaners withstand shock and vibration.

7C7 lamps are available in various colors for night lights.

Lamps intended for service under extremely high temperatures have a special basing cement and other special features which assure improved operation and longer life.

The 40A15/22 withstands range oven temperatures up to 475°F. The bake oven lamps are tested at 550°F.

The 15S11/102 and 40A15/1 lamps are used in refrigerators and appliances when small sized lamps are required.

# G-E ROUGH SERVICE LAMPS AND VIBRATION LAMPS

## ROUGH SERVICE 200PS30/23

Rough Service lamps are used in extension cords in garages, industrial plants and similar locations where they are subjected to excessive shock in service. The special construction of the filament enables these lamps to withstand sudden bumps and other forms of rough treatment.

## VIBRATION LAMPS

Vibration lamps are particularly designed for use on or near rotating machinery and other places where relatively high-frequency vibration exists. Certain of these lamps are equipped with a special type of filament wire designed to operate suitably under vibration conditions.

# G-E PILOT LAMPS AND INDICATOR LAMPS

S6-bulb lamps have many uses in homes and industry but are not designed to withstand vibration or shock. The 6T4½ lamp

is used where space requires a small lamp. The 10S11 lamps are used where more light is needed. 15T6 lamps are used in cen-

tral station power switchboards. The 11A/T4C is used on power switchboards in a G. E. receptacle containing voltage reducing resistors.

# G-E SOUND REPRODUCER LAMPS

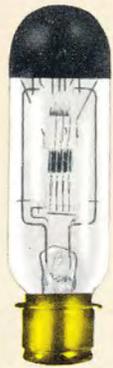

Illustrated here and described below are the most popular lamps used for theatre movie film sound reproduction. Each was pioneered by General Electric to meet the exact requirements of the optical system with which it is used. Similar lamps for 16 mm. projectors are also available.

750T24/13  
750T24/16

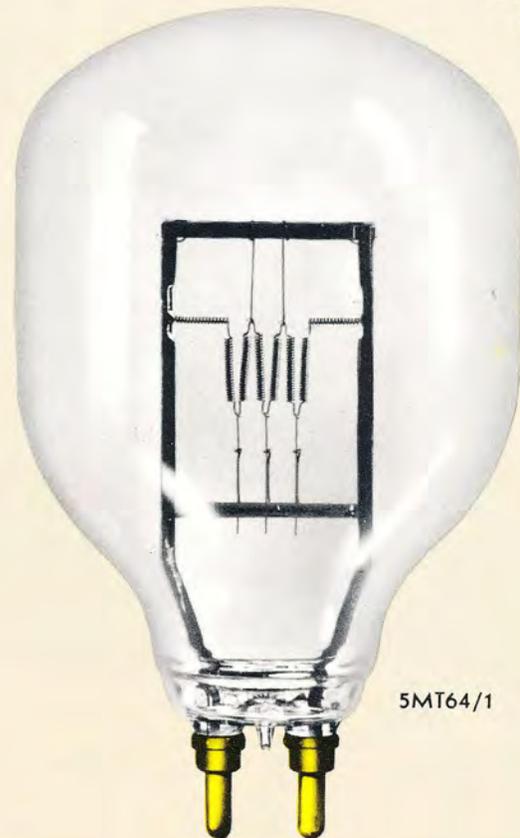

1500T24/15

900T20

The majority of General Electric lamps for picture projection are described in the Photographic Lamp Catalog. A few projection lamps normally supplied by non-photographic sources are listed herein. All are characterized by the newest and most exacting techniques of lamp manufacture. The dimensions and form of each light source are chosen to fit the particular requirement of some specific group of optical systems. General Electric Lamp Agents have a complete directory of the proper lamps to use in projectors—General Electric Lamp Division Bulletin LD-19, "Lamps for Picture Projectors."

The first two lamps listed are designed for advertising devices. Theatre projection lamps are used in smaller theatres and school auditoriums.

# G-E SHOWCASE LAMPS AND OTHER TUBULAR LAMPS

Tubular bulb lamps are for use in showcases, in displays of shallow depth, and in small trough type reflectors.

The reflector-type lamp has an inside reflectorized surface covering one side of the bulb. The conventional screw base and a spring contact on the base allow desired positioning.

# G-E MINE LAMPS

Mine lamps, ranging from 50 to 200 watts, are available in either 275 or 300 volts for use in haulage-ways, pits, shop lighting and other general lighting areas.

The PAR lamps are designed for mine locomotives, loaders, shuttle cars, and other equipment. They will give long service under severe mine conditions because of their resilient filament mounts.

The 100PAR38/FL is especially designed for use on continuous miners. Its low voltage is essential in order to obtain the ruggedness required for this service.

The 150PAR46/1, 32-volt lamp is especially designed for locomotive service. It has rugged filament construction and its concentrated beam closely fits haulage ways.

Proper resistors must be used in series with 32-volt and 115-volt lamps. Resistors to operate 150-watt lamps from nominal 275-volt supply should be selected to provide 4.69 amperes through 32-volt lamps and 1.30 amperes through 115-volt lamps.

# G-E FLOODLIGHT LAMPS AND SPOTLIGHT

250G/FL  
400G/FL

500G/FL

1M/G40FL

1500G48/6

These lamps have concentrated filaments and are used in equipments which produce accurately controlled beams of light. There are several "companion listings" of spotlight and floodlight lamps having the same dimensions but differing in life design. Floodlight lamps are used where burning hours are long, such as in building floodlighting and show window lighting. Spotlight lamps are used for stage applications where burning hours are short and higher light output is needed—particularly in the blue and green portions of the visible spectrum.

Lamps with round bulbs and C5 filament construction can be operated satisfactorily over a wide range of burning positions — such as from base down to horizontal. The C13-D filament is limited in burning position such as base up to 30°, otherwise the coils may touch and short out. Lamps with tubular bulbs are usually limited in burning position — base down or base up — so that the hot gas can rise a maximum distance above the filament before striking the bulb. Otherwise the glass may soften and bulge.

# G-E MERCURY LAMPS

Mercury lamps are highly versatile sources of radiant energy. They are efficient generators of visible light for general lighting applications for factories, for street lighting and outdoor flood-lighting. They are also common sources of ultraviolet energy used for sunlamps and for black light and photochemical effects.

Mercury lamps require correctly designed ballasts for their operation; all lamps with the same suffix number in the lamp order abbreviation are interchangeable and will operate from the same ballast design.

The characteristic blue-green light from mercury lamps appears as a "white light" but distorts the color appearance of colored objects, and for that reason are often combined with filament lamps for interior illumination.

In the newer forms some color correction is incorporated in the lamp by the use of fluorescent phosphors within the bulb. Color of light is thereby made comparable in color rendition to an equal wattage mixture of filament and regular mercury.

H400-A1  
H400-B1

For use only with auxiliary equipment designed to produce proper electrical values. Lamp wattage is approximate. For total, add auxiliary watts. Unless otherwise noted, ratings apply to operate in a-c circuits.

- (57) May not give satisfactory performance if any accessory equipment is attached to, or touches the glass bulb, should be shielded against moisture falling on the bulb.
- (84) Life under specified test conditions with lamps turned off and restarted no oftener than once every 5 burning hours.
- (85) Initial lumens after 100 hours operation. Life under specified test conditions with lamps turned off and restarted no oftener than once every 5 burning hours.
- (86) Horizontal burning approved with or without magnet; so operated, published life ratings apply but watts and lumens are reduced.
- (87) Burning position within 10° of vertical base up.
- (90) Initial lumens after 100 hours operation. Rated average life under specified test conditions; with 5 burning hours per start, 4000 hours; with 10 burning hours per start, 6000 hours.
- (91) Opaque coating on reflecting section of bulb.
- (92) When H100-A4 lamps are operated on direct current a polarity reversing switch should be installed to avoid the possibility of electrolysis in the lamps.
- (94) Burning position must be within 10° of vertical base down.
- (96) Rated average life under specified test conditions with 5 burning hours per start 5,000 hours; with 10 burning hours per start, 6,000 hours; with 144 burning hours per start, 10,000 hours. Initial lumens apply at end of 100 hours operation.
- (98) Horizontal burning approved with magnet holding arc approximately centered; so operated, published life ratings apply but watts and lumens are reduced.
- (104) Approximate initial lumens after 100 hours operation.
- (107) Approximate life under specified test conditions with 5 or more burning hours per start.

# G-E MERCURY BLACK LIGHT LAMPS

H100-A4

H100-FL4

H100-SP4

H100-BL4

"Black Light" is a popular name for near ultraviolet energy in the 3200A-4000A band. These invisible rays cause many materials to glow. The process is used for stage and decorative effects, industrial inspection and production, detective work, mineral exploration, medical applications, and advertising.

To be effective visible light emitted by the source must be absorbed by a filter. In the H100-BL4, 250A21/60, and in the

F40T12/BLB the lamp bulb itself is the filter made of dark purple glass which absorbs nearly all the visible light and transmits a high percentage of black light. The other lamps require separate filters for most applications.

Reflectors are desirable with all lamps (except the H100-SP4 and H100-FL4 which have built-in reflectors) to direct the energy effectively.

250A21/60

The fluorescent black light lamps are much more efficient than the mercury types, but require more space. The 250A21/60 is an incandescent lamp for intermittent burning in a regular socket. It is used where small concentrations of energy are sufficient. The F5000, F2T6/BL and F3RP12/BL are specialized lamps primarily for instrument lighting on aircraft.

# TRANSFORMERS FOR G-E MERCURY LAMPS

TYPICAL ENCLOSED TRANSFORMER

CORE AND COIL TRANSFORMER

The table below shows the various types of transformers and reactors for the operation of mercury lamps. It will be noted that lamps having the same last numeral in the ordering designation can be operated from the same type of transformer. More complete technical information on mercury lamps, as well as transformer dimensions and wiring diagrams is available in G. E. Lamp Department Bulletin LS-103.

# G-E OZONE LAMP

OZ4S11

Ultraviolet from the General Electric Ozone Lamp passes through the special glass bulb and acts on the oxygen in the air to form ozone, which has the unique ability to destroy many objectionable odors.

The G-E Ozone Lamp will kill the odors in a small room, banish smells in a short time after cooking, prevent mustiness, and eliminate stale after-odors of tobacco smoke.

Ozone lamps are generally operated in shielded fixtures mounted on the wall just

above eye level. They can also be operated inside enclosed air circulating devices. In either application one ozone lamp should be used for each 1000 cubic feet of space served.

A ballast must be used with the ozone lamp — G-E Catalog No. 89G418 is available for operation on 110-125 volt 60-cycle current. A standard 40-watt filament lamp may also be used as a ballast.

<sup>①</sup> Approximate life under specified test conditions with continuous burning.

# G-E SUNLAMPS

RS

S-1

Sunlamps provide ultraviolet, effective in producing sunburning and tanning. They provide the equivalent of vitamin D for prevention and cure of rickets in infants and are also used for irradiating animals and poultry.

Both 400-watt S-1 and 275-watt RS lamps provide sufficient radiant heat along with the ultraviolet to permit their comfortable use in rooms where the air temperature might otherwise be too cool for adequate exposure of the body. The S-1 sunlamp is made available for replacement purposes in the special operating equipment it requires. The RS sunlamp operates on standard 110-125 volts, 50- or 60-cycle alternating current and therefore is the most popular type sunlamp. It can be used in any lampholder but special floor stands or clamp-on type holders are generally more flexible and more convenient.

## GENERAL PURPOSE LAMPS

Infrared lamps have many uses in the home, in industrial and commercial applications and on the farm for heating, drying and for brooding of poultry and animals.

They also have wide usage as a source of penetrating heat to help relieve muscular aches and pains, the discomfort of neuritis, sinus pains, and arthritis.

The R-40 type lamps have a built-in reflector which efficiently directs the radiant heat to objects or target areas. G-30 and T-40 lamps require separate reflectors. The popular 250R40/10 lamp is made of heat-resistant glass with a built-in red filter. The heat-resistant glass provides protection

against breakage by splashing water. The built-in red filter reduces the brightness of the lamp. The 250R40/1 is a low cost general purpose lamp.

## INDUSTRIAL INFRARED LAMPS

In industry, infrared lamps are used for quick heating of a great variety of products. Advantageous features of these lamps include rapid heat transfer, efficient operation, simple oven construction, low oven first cost, adaptability to conveyerized production, cleanliness and low maintenance.

The line of infrared lamps comprises several wattages in each bulb size; this interchangeability permits a range of temperatures in an oven.

# G-E GERMICIDAL LAMPS

Germicidal lamps provide 2537°A ultraviolet, effective in destroying molds and bacteria. They have wide application in hospital nurseries, contagious wards and surgeries, as well as in schools, offices, theatres and other places where air sanitation is needed. They also provide product protection for foods, pharmaceuticals and beverages. On farms they offer an important supplement to the usual sanitation methods practiced by poultrymen, dairymen, and stock raisers.

# G-E LAMPS FOR HOSPITALS AND MEDICAL INSTRUMENTS

Microscope lamps, in compact spotlights, are used to illuminate specimens on the microscope stage.

The 200P25/26 lamp, is an inside-frosted daylight bulb. Some X-ray illuminators use daylight fluorescent lamps.

The 15S11/14 lamp has a concentrated filament and clear bulb.

The elongated filaments and small bulb diameter of the 25T6<sup>1</sup>/<sub>2</sub> lamps are designed to light the dials of scales of weighing equipment. The bayonet base will not vibrate loose.

## HOW TO ORDER LAMPS

**Purchasers are urged to order in standard packages to expedite service and to assure best discount.**

Quantity desired of each type of lamp should be specified.

Lamps should be ordered by the Lamp Ordering Abbreviations provided in this catalog for each type. Each abbreviation is complete for ordering

without any other specifications, except that the correct voltage must be specified. Abbreviations which are complete without voltage include the series lamps listed in lumens and amperes, fluorescent lamps, and the lamp numbers for General Electric Sunlamps and General Electric Mercury Lamps.

Orders for lamps not specifically listed herein will require the complete specifications, as to size Volts or Amps, Bulb, Base, Finish and Service.

Voltage limits shown as 115-125 indicate that the lamps are intended for use on circuits with voltages normally falling within these limits and are designed at a voltage suitable for such use.

Standard Voltage, as referred to herein, includes 115-, 120- and 125-volts. High Voltage includes 230- and 250-volts.

### LAMP AND LIGHTING PUBLICATIONS

To assist in proper application of General Electric Lamps, the following Application Engineering publications are available from Sales District offices:

LD-1	Lamp Bulletin (filament, mercury, fluorescent and other discharge)
LD-2	Fundamentals of Light and Lighting
LS-135	Lamps and the Spectrum (A section of LD-1)
LS-119	Levels of Illumination
LS-155	Lighting Maintenance — Group Relamping
LS-166	Lighting Maintenance — Cleaning
LS-108	Visual Comfort Index
LS-101	Fluorescent Lamps and Auxiliary Equipments
LS-102	Fluorescent Lamps, Engineering Data on Lamps and Auxiliary Equipments (A section of LD-1)
LS-121	Fluorescent Lamps and Radio Interference
LS-148	Fluorescent Lighting in the Home
LD-17	Circline Fluorescent Lamps
LS-103	Mercury Lamps and Ballasts (A section of LD-1)
LD-11	Germicidal Air Sanitation
LD-14	Ultraviolet Product Sanitation
LS-128	G-E Industrial Infrared Lamps, Data and Application
LS-168	Lighting for Plant Growth
LS-160	Ozone Lamp Applications
LS-152	Reflector and Projector Lamps
LD-4	Planned Lighting For Industry
LD-20	Industrial Lighting Outdoors — for Production — for Protection
LD-10	Lighting for Sports and Recreation
LS-106A	Analysis of Street Lighting Costs as Affected by Lamp Replacement Practice
LS-169	Office Lighting Manual
LS-129	Package of Lighting Ideas for Your School
LS-161	Lighting for Stores
LS-162	Built-in Lighting and Planned Environments
LS-132	New Patterns for Lighting You Have
LS-171	Lighting Outdoors for Family Living
LS-123-R	Ideas For Outdoor Christmas Lighting
