## COIN EQUIPMENT

 2400S-2400, 2410S-2410, 2404S-2404References to "Right hand" and "Left hand" are made when viewing the phonograph from the front, unless otherwise specified.

The coin equipment used on all Wurlitzer 1960 Models consists of the conventional slug rejector assembly and either the single pricing coin register mechanism (playrak) or Wurlitzer's dual pricing coin register mechanism. These units are mounted inside of the right hand panel. The figures following show the method for removal of the units. The various parts are identified and listed as an aid in describing the adjustments which follow.

Although those phonographs shipped from the factory with the playrak coin register mechanism are set for: 1 play - dime, 3 plays - quarter, and 7 plays, - half dollar; they may be adjusted to nickel selection if desired. Remove the two screws (Fig. 2, Items 8 \& 9), and set the nickel flipper (Item 10)
in the position shown. Reverse the location of screws (Items 8 \& 9) and replace the slug rejector. Move the slide switch (Fig. 1, Item 2) to the 5-1025 position and reset the stop levers to the desired number of credits as shown in Figure 2, Item 2. The front plate of the playrak (Fig. 2, Item 1) is cut back to provide clearance for raising the unit and disengaging its hinge pins as shown in Figure 2, Item 11 .

## CAUTION I

Turn the line switch OFF before removing the playrak!

Fig. 2. REMOVAL OF COIN EQUIPMENT

| 10. Nickel Flipper | National |
| 11. Pin, Hinge, (2) | 66445 |

The 5-10-25 slug rejector may be removed by first removing the coin separator (Fig. 2, Item 6). The procedure is as follows: Raise the lower coin chute (Fig. 1, Item 9). Unlatch the lever (Item 10) and move the lever and bracket assembly aside. Release the latch spring (Fig. 1, Item 7), lift and remove the coin separator (Item 12) and the slug rejector as shown in Figure 2, Item 7.

## CAUTION!

When replacing the slug rejector, handle with care so as to prevent damage to the nickel flipper (Fig. 2, Item 10).

The preceding instructions will also apply to the dual pricing coin register mechanism as shown in Figure 3.

The dual pricing coin register mechanism is a combination slug rejector and credit accumulator which will store up to a maximum of 20 credits. The unit is mounted on three shoulder screws and held by two shipping screws shown at Item 3 . The entire assembly may be removed by disconnecting the cable plugs at the junction box, removing the two shipping screws mentioned above, lifting the slide. lock (Fig. 3, Item 5) and disengaging the lever and bracket assembly (Item 7). Slide the top of the assembly back on its slotted mounting holes, tilt
it toward the changer mechanism and lift off. Pricing changes may be made without removing the entire assembly. The pricing board is accessible by removing the cover and liner assembly (Item 10). Information on the various pricing arrangements is printed on the cover. By turning in the screws on the printed board (Fig. 4, Item 11) until contact is made with the patches, credits will be increased according to the instructions on the cover and liner assembly.

| 13. Accurnulator Assembly | 114037 |
| 14. $5-10-25$ Slug Rejector | National |

Slug rejectors are the same on all models and are a product of National Rejector, Inc., of St, Louis, Missouri. It is recommended that National Rejectors, Inc., and their branch offices be employed for service or replacement of parts other than those indicated by Wurlitzer numbers. The mechanical adjustment of National components of the slug rejector assembly should be made in accordance with the "Rejector Manual", furnished by National Rejectors, Inc.

## 1. PLAYRAK ADJUSTMENTS

CAUTION!
Make these adjustments with the power OFF!

## a. COIN SWITCH

The coin switches should be adjusted to provide a $1 / 32^{\prime \prime}$ opening of the contact points. This adjustment should be made when the coin paddle (Fig. 5, Item 3) is held against the coin exit of the rejector by the tension of the coin switch movable blade. The tension of the movable blades should be adjusted so that a thin coin, when stopped on the paddle and released, will actuate the movable blade; making contact with the stationary blade and clear the paddle. A pulse of more than 3 seconds duration should normally blow the .8 ampere fuse in the coin magnet (Fig, 6, Item 6) circuit.

Fig. 5. COIN SWITCH ADJUSTMENT

1. Critical Point
2. Coin
3. Coin Paddle

The final test for the coin switches should be made with the coin assembly in the phonograph in its normal operating condition. Test each individual coin track, ten consecutive times, with coins of varied wear. If one coin fails to register correctly, that particular coin switch should be reexamined and if necessary, readjusted.

Before proceeding to playrak adjustments, check for the condition shown in Figure 6, Item 1. When the studs (Item 4) on the lower end of the two lever, hub and stud assemblies are engaged with the

6. Coin Magnet, Coil Assembly

65770
first tooth of their respective accumulator wheels, as shown, the drive pin (Item 2) of the cancel wheel should rest squarely against the edge of the two accumulator wheels. Should this condition not exist, examine the playrak for bent studs or sprung frame. Correction should be made before proceeding with adjustments.

## b. KEY SWITCH ADJUSTMENT

The key switch and bracket assembly may be adjusted by loosening its mounting screws (Fig. 7, Item 2) and moving the bracket to provide $1 / 32^{\prime \prime}$ opening of the key switch contacts (Item 3) when the insulating stud (Item 1) on the cancel wheel is resting slightly on the flat portion of the formed tip of the blade. With one credit on the accumulator wheel, the actuator (Fig. 8, Item 1) should clear the formed tip of the key switch blade as shown in Item 2.

4. Screws, Cancel Solenoid Adjustment

73533-22

Fig. 8. KEY SWITCH CLEARANCE ADJUSTMENT

1. Actuator, Key Switch

58255
2. Clearance from Movable Blade

## c. STOP LEVER AND QUADRANT INDEXING STRIP

The stop levers (Fig. 9, Item 3) should be set at 5 credits and the escapement studs released, allowing the two accumulator wheels to advance to 5 credits. The drive pin on the cancel wheel (Fig. 10,

Fig. 9. STOP LEVER AND QUADRANT INDEXING STRIP ADJUSTMENT

5. Indexing Strip, Quarter
6. Screws, Adjusting, Index Strips
7. Screws, Cancel Solenoid Adjustment 73533-22
8, Guard, Cancel Pawi
8. Pivot Arm Assembly

Item 1) should rest squarely against the edge of the accumulator wheels (Item 2). Should this condition not exist, loosen the indexing strip adjusting screws (Fig. 9, Items $2 \& 6$ ) and with the $10 \phi-50 \phi$ indexing strip set at the center of its adjusting range, move the $25 \phi$ indexing strip until the above condition is met. Tighten the adjusting screws in the indexing strips.

Fig. 10. STOP LEVER AND QUADRANT INDEXING STRIP ADJUSTMENT

1. Driver Pin, Cancel Wheel

66045
2. Accumulator Wheel and Hub Assembly 66131

## d. CANCEL STROKE ADJUSTMENT

The cancel solenoid mounting screws should be loosened and the solenoid backed off before making this adjustment. The adjustment is made with the eccentric cam (Fig. 11, Item 3). The cancel stroke should be sufficient to return the accumulator wheel one full tooth plus . $010^{\prime \prime}$ overtravel, as shown in Figure 12, Item 1.

NOTE!
The thickness of the red instruction tags accompanying the phonograph is approximately $.010^{\prime \prime}$.

With cancellation held manually in position, as shown in Figure 11, Item 1, set the cancel solenoid up on its mounting bracket until its plunger is firmly bottomed. Tighten the adjusting screws and check for correct cancel action.

Fig. 11. CANCEL STROKE ADJUSTMENT

3. Adjustment Cam, Eccentric 42868
4. Pin and Pawl Assembly 66127

Fig. 12. ECCENTRIC CAM ADJUSTMENT FOR CANCEL STROKE 1. Dimension, .010" Overtravel

## e. CANCEL PAWL STOP BRACKET ADJUSTMENT

Loosen the adjustment screws (Fig. 13, Item 1) and move the stop bracket to permit the cancel pawl to engage the tooth of the cancel wheel at a point $1 / 3$ the length of the slant surface from the tip of the tooth (Item 3). During cancel operation, the cancel pawl stop bracket should be free from the edge of the cancel pawl (Item 4) marked 'No Drag'"

Fig. 13. STOP BRACKET ADJUSTMENT

3. No Drag of Pawl on Bracket

## 2. DUAL PRICING COIN MECHANISM ADJUSTMENT

Figure 14 is the dual pricing coin register mechanism with the covers and the slug rejector removed. The various components named, will be referred to in the following adjustment procedures and in the Trouble Shooting Chart. The unit is further broken down as an aid in viewing the various adjustments.

## a. ACCUMULATOR PAWL ADJUSTMENT

Loosen the accumulator coil adjusting screws (Fig. 15, Item 3). Insert a .005" shim (Item 4) the full length of the radius gap between the armature and the magnet. Manually hold the armature in the operated position and move the magnet coil to provide a uniform . $005^{\prime \prime}$ clearance throughout the length of the arc and also provide $.002^{\prime \prime}$ to $.005^{\prime \prime}$ clearance as indicated at Item 1. Tighten the adjusting screws and recheck for correct requirements.

## b. CANCEL PAWL STOP BRACKET

Manually add three or more credits on the accumulator wheel (Fig. 15, Item 10). Holding the cancel solenold plunger (Fig. 16, Item 5) in its operated position, adjust the stop bracket (Fig. 15, Item 9) for a maximum clearance of $1 / 64^{\prime \prime}$ (Fig. 17, Item 1) between the bracket and the pawl.

10. Cap, 6 Circuit
11. Socket, 9 Circuit
12. Socket, 6 Circuit

## c. INDEXING OF PRINTED BOARD

With one credit on the accumulator wheel, the contact spring (Fig. 18, Item 1) should rest in the center of the $5 \dot{\phi}$ credit light patch (Item 3). The printed board may be rotated slightly by loosening its 4 mounting screws, 2 of which are shown at Items 2 and 4.

## d. CANCEL SOLENOID ADJUSTMENT

The cancel action is factory set to take 3 credits off the accumulator wheel for each selection made. Through the circuitry of the pricing bars (Fig. 23, Items $20 \& 22$ ) and the pricing relay (Fig.
114928
114889

| 24. Adjusting Screws, 8-32 x 1/4", R.H. | $73533-34$ |

14, Item 2) one credit will be added before cancellation when a $10 \not \subset$ selection is made.

To adjust the cancel solenoid, loosen the adjusting screws (Fig. 16, Item 6). Add 3 or more credits on the accumulator wheel. Holding the cancel solenoid plunger firmly bottomed in the solenoid, position the solenoid to just cancel 3 teeth at the escapement pawl (Fig. 15, Item 7). While holding the cancel solenoid plunger actuated, recheck the cancel pawl stop bracket (Fig. 15, Item 9) setting. The ratchet wheel should be securely engaged by the tip of the cancel pawl and stopped by the stop bracket, preventing further rotation of the ratchet wheel. Should this interlocked condition not exist, reset the cancel pawl stop bracket (adjustment b.).

## e. COIN CASTING ADJUSTMENT

The adjusting screws (Fig. 19, Items 5 \& 6) may be loosened to permit shifting of the coin casting (Item 4) so that its four coin tracks align with the four exits of the slug rejector. The 5-1025 and $50 \phi$ coins should pass freely from the slug rejector through the coin casting.

73533-34

## f. COIN SWITCH ASSEMBLY ADJUSTMENT

## CAUTION!

Turn the power OFF before proceeding with the following adjustments.

Each of the four coin paddles (Fig. 19, Item 2) should align accurately with their respective coin tracks. The retracting tension of the movable blades (Fig. 20, Item 6) should hold the coin paddles against the coin casting (Fig. 19, Item 4) in the at rest position. The $5 \notin$ coin switch contacts should have a . $030^{\prime \prime}$ opening and as the coin actuates the paddle it should deflect the stationary blade $.030^{\prime \prime}$, passing freely into the cash bag. With 10,25 , and $50 \phi$ coins resting on the lower coin stop (Fig. 20, Item 1). Lift each paddle to normal rest position and then release. The weight of each coin should operate its coin switch with .030" wiping action. The normally open coin switch contact gap should be $.040^{\prime \prime}$ to $.055^{\prime \prime}$ for the 10,25 and $50 \phi$ switches.

3. Coin Stop Arm Assembly, Lower 113927
4. Spring, Retracting, Lower Coin Stop Arm 59894
5. Actuator, Coin Paddle
6. Movable Blade, Coin Switch

## g. FULL CYCLE SWITCH ADJUSTMENT

The full cycle switch (Fig, 21, Item 3) should be set to provide good contact with at least $.030^{\prime \prime}$ wiping action. The opening of the contacts, when actuated by the cam end of the upper cotn stop arm (Item 5), should occur at a point that will stop the mechanism with the adjusting screw and bearing assembly (Item 4) in the detent of the actuating cam (Item 5).

## h. CONTACT SPRING PRESSURE SETTING CREDIT LIGHTS AND ACCUMULATOR

The contact springs (Fig. 22, Item 1) of the credit light circuits should have 15 to 30 grams pressure against the printed board. The rotary contact arm (Item 2) should also have 15 to 30 grams pressure against its printed board.

## 3. SELECTOR SWITCH ADJUSTMENTS

Due to the similarity between the selector switch assemblies, only close up views of the $2400-\mathrm{S}$ and the 2404 are shown. Adjustment procedures are similar on all models. The selector switches, both letter and number, the push buttons and their respective latch bars (Fig. 24, Items 3, 6 and 9) must work freely with no bind. The latch bars must engage and disengage the push rods freely as the selector buttons are depressed and released. Should this condition not exist, examine the selector switch assembly for binds and correct before making any adjustments.

## a. SELECTOR SWITCH CONNECTOR LINK ADJUSTMENT

Figure 24 shows the underside of the 2400-S selector switch assembly. The comnecting link (Item 5) between the two letter switch banks, synchronizes the movement of the letter switch latch bars (Items 3 and 9) and must be accurately set before making

Fig. 24. CONNECTOR LINK ADJUSTMENT, 2400

| 9. Latch Bar, Letter Switch Assembly |  |

further adjustments. Press a letter button in the left bank and note the travel on its latch bar. Then press a letter button in the right bank, its latch bar should have exactly the same travel. Should the movement of the two latch bars vary, they may be synchronized by loosening the adjusting screw (Item 4) and shifting the connector link. The connector link (Item 5) is coupled to the shaft, link, and lever assembly (Item 2) by an adjustable clip (Item 7). This cllp should be adjusted for minimum backlash consistent with freedom of movement. The same coupling method is employed between the number switch latch bar (Item 6) and its shaft, link, and lever assembly (Item 1). The adjusting screw (Item 8) may be loosened and the clip set to remove any backlash. Figure 25 shows the underside of the 2404 selector switch assembly. The number switch latch bars (Items 12 and 17) are comnected together by the link (Item 8). The two latch bars may be synchronized by loosening the adjusting screw (Item 10) and shifting the connecting link. The clip, held by the adjusting screw (Item 2) should be set for minimum backlash consistent with freedom of movement. The letter switch latch bar (Item 7) is adjustable for minimum backlash by loosening the adjusting screw (Item 5) and moving the adjusting clip.

The 2410 selector switch assembly shown in Figure 26 has one number switch bank and one letter switch bank and will therefore not need synchron-

izing. The backlash between the latch bars and the shaft, link, and lever assemblies (Items 1 and 2) can be adjusted by means of the screws shown at Items 3 and 4.

## b. LATCH SOLENOID STOP BRACKET ADJUSTMENT

The latch switches and control switch have been removed in Figure 27 as an aid in viewing the adjustment discussed. This adjustment should be made with the crank and link (Item 9) in its normal

Fig. 27. STOP BRACKET ADJUSTMENT

rest position. Loosen the two adjusting screws (Item 6) and move the stop bracket (Item 7) to provide $1 / 32^{\prime \prime}$ clearance (Items $1 \& 4$ ) between the square studs and their adjacent levers. This adjustment applies to all of the 2400 series.

## c. LATCH ADJUSTMENT

The adjusting screws (Fig. 28, Items 9 and 10 ) serve to take up the backlash in their respective linkages. Energize latch solenoid. Manually hold a letter button fully depressed. Loosen the screw (Item 10) and allow the square stud (Item 2) to seat itself in the notch of the trip lever (Item 3) and tighten the screw. Check all letter buttons for positive contact of their respective slide switches when the button is latched. The number button latching is adjusted in the same manner while manually holding a number button fully depressed. The adjusting screw (Item 9) should be loosened, allowing the square stud (Item 7) to seat in the notch of the trip lever (Item 8). Tighten the adjusting screw and check each number button for positive contact of their respective slide switches. This adjustment applies to all of the 2400 series.

Fig. 28. RELEASE LEVER ADJUSTMENT

56712
8. Trip Lever and Spacer Assembly, Number 65010
9. Screw, Number Latch Adjusting
10. Screw, Letter Latch Adjusting

## d. RELEASE LEVER CLEARANCE ADJUSTMENT

Before attempting this adjustment, remove the latch solenoid control switch assembly (Fig. 29, Item 4). Loosen the latch solenoid adjusting screws (Fig. 28, Item 1). Manually hold the latch solenoid plunger in the actuated position with the plunger bottomed in the solenold. Latch in a letter and a number button. Holding this condition, shift the latch solenoid on its mounting to provide a $1 / 32^{\prime \prime}$
clearance at the release tabs (Fig. 28, Items 4 and 6). Carefully maintain this setting and tighten the latch solenoid adjusting screws. This adjustment applies to all 2400 series.

## e. CONTROL SWITCH ADJUSTMENT

Manually hold the latch solenoid plunger (Fig, 29, Item 1) in the actuated position. Loosen the adjusting screws (Item 5) and move the control switch and bracket to provide $1 / 32^{\prime \prime}$ to $1 / 16^{\prime \prime}$ opening of its normally closed contacts. The normally open contacts on the 2400 and 2410 models should close with a good wiping action.

10. Screws, Letter Series Switch Adjusting
11. Switch Assembly, Letter Series

111810

## f. LETTER AND NUMBER LATCH SWITCH ADJUSTMENT

The latch switches are adjusted at the factory with all contacts normally open $1 / 32^{\prime \prime}$. When the latch solenoid coil is energized and a letter button is latched in, the letter latch switches should close with a $1 / 32^{\prime \prime}$ wiping action. Release the Ietter button by operating the "Release" button and latch in a number button. The number latch switch should close with a $1 / 32^{\prime \prime}$ wiping action. Should adjustment be required, the latch switch mounting brackets may be moved by loosening the mounting screws (Fig. 29, Items 2 \& 7). This adjustment applies to all of the 2400 series.

## g. LETTER AND NUMBER SERIES SWITCH ADJUSTMENT

The series switches are factory set to be normally closed with 30 to 40 grams contact pressure. With the latch solenoid plunger actuated and a letter selector button in its latched position, the
letter series switch (Fig. 29, Item 11) should have a contact opening of $1 / 32^{\prime \prime}$. The switch mounting screws (Item 10) may be loosened and the bracket moved to provide the proper adjustment. The number series switch (Item 9) may be adjusted in the same manner by loosening the mounting screws (Item 8). This adjustment applies to all of the 2400 series.

| 13. Nylon Gear, Selector Motor | 68717 |

## 4. ELECTRIC SELECTOR ADJUSTMENTS

## a. ROTATING PLATE AND ROCKER ARM ADJUSTMENT

Rocker plate alignment on the 200 selection pin assembly is accomplished by adjusting the number quadrant's (Fig. 31, Item 1) forward stop screw (Item 4). Turn the power OFF, depress the number " 0 " solenoid plunger (Itern 16) and turn the rotating plate and rocker arm assembly (Item 12) in a clockwise direction by turning the nylon gear (Item 18) of the selector drive motor. One of the 10 stop pins (Item 8) will engage the depressed plunger of the number " 0 " solenoid. Continued rotation of the nylon gear will drive the number quadrant (Item 1) until it rests against the forward stop screw (Item 4). In this position, the tips of the rocker arms (Fig. 30 , ltem 12) should be very slightly off center to the right, with the selector pins number " 0 " of each letter group A to V. Holding this position, check the letter solenoid plungers to see that they align
with the rocker arm actuator bar (Fig. 30, Item 8). Repeat the above procedure using number " 1 " stop solenoid, rechecking the alignment of both the rocker arm tips and the actuator bars. Should adjustment be required, the stop screw (Fig. 31, Item 4) may be set to provide the correct alignment.

16. Solenoid, Selector Stop, Number 2-0 68617
17. Socket, 3 Circuit 111526
18. Nylon Gear, Motor and Gear Assembly 111913

## b. START SWITCH ADJUSTMENT

The start switch (Fig. 30, Item 6) should be checked after any adjustment of the forward stop screw. It is actuated by the forward movement of the number quadrant. The actuating screw (Item 3) should be set to actuate the switch with $1 / 32^{\prime \prime}$ to $3 / 64^{\prime \prime}$ overtravel. The following method may be used to adjust the start switch. While manually holding the number coil quadrant in its forward stop position with the nylon drive gear, back out the start switch actuating screw until the switch actuates, then turn the screw in until the switch again actuates. Continue one full turn of the screw beyond the point of actuation.

## c. BACK STOP SCREW ADJUSTMENT

The number quadrant (Fig. 31, Item 1) in its normal rest position is held against backstop screw (Item 13) by its retracting spring (Item 14). This adjusting screw should be set to provide $1 / 16^{\prime \prime}$ overtravel of the number quadrant (Item 1) after the start switch (Fig. 30, Item 6) resets on return of the number quadrant.

## d. REVERSE SWITCH ADJUSTMENT

This adjustment should follow any adjustment of the back stop screw. While the number quadrant is in its normal rest position turn the adjusting screw (Fig. 30, Item 4) in until the reverse switch actuates. Then turn the adjusting screw (Item 4) out until the reverse switch resets. Turn the adjusting screw out an additional $1 / 2$ to 1 turn for correct overtravel.

## e. OVERRIDE SWITCH ADJUSTMENT

When a selector latch pin (Fig. 32, Item 1) is released the wobble ring (Item 7) is moved upward by the tension of the selector latch pin spring (Item 9). The spacer (Item 8) closes the contacts of one override switch. To check for correct switch action choose a selector pin midway between 2 spacers. Release the pin and slowly work the pin up and down. The override switch contacts at either side of the selector pin should close with good wiping action and allow the selector pin to make its full travel. Each pair of override switches should be checked using pins $\mathrm{E}-8, \mathrm{~K}-8, \mathrm{Q}-8$ and

8. Spacer, Wobble Ring

68650
9. Spring, Latch Pin

110480
$\mathrm{V}-8$. The override relay can be heard to operate and release as the switches make and break. The relay actuation and release should occur at approximately $1 / 3$ the travel of the selector pin. Should adjustment be required it may be accomplished by forming the blades of the override switch with a suitable contact adjusting tool. The foregoing adjustment will apply to the 100 and 104 selector pin assembly although the override switches are mounted on the wobble plate.
(1) Pins number A-6, D-2, F-5 and H-10 should be used to check the override switches on the 100 selection pin assembly.
(2) Pins number $\mathrm{A}-20, \mathrm{~A}-23$ and $\mathrm{D}-13$ should be used to check the override switches on the 104 selection pin assembly.

## f. ROTATING PLATE AND ROCKER ARM ADJUSTMENT - 2410S AND 2410

(1) The adjusting screws (Fig. 33, Item 8) should be loosened and the guide plate set to zero clearance with the stop bracket (Item 5) on the rocker plate assembly.
(2) The adjusting screw (Item 9) should be set to align the tips of the rocker arms (Fig. 35, Item 1) with the selector pins number 3, A through

Fig. 33. ELECTRIC SELECTOR, 2410

K and with the selector pins number 8, A through K . This is the normal rest position for the rocker plate assembly.
(3) Loosen the three mounting screws (Fig. 33 , Item 11) and manually move the rocker plate until the stop bracket (Item 5) rests against the extreme right hand stop (Item 7). In this position the tips of the rocker arms (Fig. 35, Item 1) should align with the selector pins number 1, A through $K$ and pins number 6 , A through K . The mounting plate held by the screws (Item 11) may be moved to provide the correct alignment.
(4) Check the rocker arm alignment while holding the rocker plate in the extreme left hand stop position (Item 3). The tips of the rocker arms should be in alignment with selector pins number 5 , A through K and pins number 0 , A through K .

Fig. 34. ELECTR1C SELECTOR, 2410

| 6. Latch Pin, Selector, Inner (50) | 115806 |
| 7. Over Ride Switch, Contact Assembly | 115918 |

(5) Check the right hand intermediate position by manually operating the stop magnet armature (Item 2) and moving the rocker plate to position the stop bracket (Item 5) against the armature stop (Item 6). In this position the tips of the rocker arms should align with the selector pins number 2 , A through K and pins number 7, A through K. Should adjustment be required the armature plate stop tab (Item 6) may be formed.

66186
5. Wobble Plate

115796
6. Selector Solenoid (20)

64602
(6) The left hand intermediate stop position should be checked in the same manner as for the right hand. The stop bracket (Item 5) will be manually held against the intermediate stop on the stop magnet armature (Item 4). The rocker arm tips should align with the selector pins number 4, A through $K$ and pins number 9 , A through $K$. Should adjustment be required the stop tab on the armature plate (Item 4) may be formed.

## g. STOP MAGNET SWITCH ADJUSTMENT

The stop magnet switch (Fig. 33, Item 1) should be set to provide a $1 / 32^{\prime \prime}$ gap at the normally open contacts and have a $1 / 32^{\prime \prime}$ wiping action when the switch is actuated. They should be adjusted to make before break.

## h. ROTATING PLATE AND ROCKER ARM ADJUSTMENT - 2404

(1) The rocker plate is adjusted in its normal at rest position by loosening the 3 mounting screws (Fig. 36, Item 1) and shifting the stop coil assembly (Item 2) to locate the tips of the 26 rocker arms in alignment with the number 1 to 26 selector

Fig. 36. ELECTRIC SELECTOR ASSEMBLY

64653
7. Rocker Arm Tip
pins in the "A" group (Item 7). Manually move rocker plate to the limit of its travel and check the alignment of the tips of the rocker arms with 1 to 26 " D " selector pins. The stop coil mounting plate may be moved to obtain a satisfactory alignment at " $A$ " and " $D$ " positions.
(2) Manually operate " B " stop lever (Fig. 36, Item 5) and move the rocker plate to rest against the "B" stop (Item 5) and check the alignment of selector pins 1 to 26 in the " $B$ " group with the tips of the rocker arms. Should adjustment be necessary the stop tab may be formed. Manually operate the "C" stop armature (Item 6) and move the rocker plate to the "C" stop position. The tips of the 26 rocker arms should align with the 26 pins in the "C" group. The stop tab on the " C " stop magnet armature may be formed if adjustment is required.

## i. SELECTOR DRUM CENTERING

(1) Centering of the 200 selection electric selector assembly must be carefully done whenever the selector pin assembly is removed from the mechanism. The assembly is held in position by two mounting screws (Fig. 37, Item 6) and by the mounting plate (Fig. 30, Item 7) at the rear of the assembly. Observe the caution label on the rear plate and remove only the upper two screws.

Fig. 37. ELECTRIC SELECTOR CENTERING

1. Guide Plate, L.H. 68757
2. Guide Bracket, L.H.
3. Centering Shaft
4. Guide Bracket, R.H.

69247
68760
6. Mounting Screws (2)

The front edge of the casting is provided with two guide brackets (Fig. 37, Item 2 \& 4) which fit over two guide plates (Item 1 \& 5) on the front hangers. The engagement of these brackets serves to support the front of the selector pin as sembly while the rear mounting plate is securely fastened by its upper screws. Centering shaft \#69247 (Item 3) shipped with each phonograph, should be inserted through the center bushing and into the main selector shaft. The 2 front mounting screws (Item 6) should be turned in by hand until the selector pin assembly is in contact with the front hangers. While in this condition the selector pin assembly should be positioned so that the centering pin slides in and out of the main shaft freely. Maintaining this allgnment the front screws should be tightened. Carefully check the selector crank arm adjustments and check for correct selections.

Fig. 38. ELECTRIC SELECTOR CENTERING

1. Uniform Clearance at all Points
2. Centering Clip

117006
j. Centering of the 100 selection selector pin assembly normally is not required if the original assembly is retained with its changer. The mounting is the same as the 104 assembly. However where selector pin assemblies are interchanged on the 100 selection changer the guide plates, one of which is shown in Figure 39, Item 3, should be loosened. The assembly loosely mounted on the three studs and centering shaft \#69247 inserted through the center bushing (Fig. 33, Item 10) into the main shaft. Tighten the guide plate retaining screws and the three mounting screws. Remove the centering shaft and check the selector crank arm adjustments and for correct selections.
(1) Centering clip 117006 may be used as shown in Figure 38, Item 2 of the 200 selector assembly where centering shaft \#69247 is not available.

Fig. 39. GUIDE PLATES AND MOUNTING

1. Stud, Mounting, Selector (3) 64543
2. Selector Pin Assembly Mounting Screw (3) 73793-150
3. Guide, Alignment (3)

61850
4. Alignment Plate Petaining Screws, $8-32 \times 3 / 4^{\prime \prime}$, R.H. $73533-40$
$k$. Centering of the 104 selector pin assembly has been carefully done at the factory and if the original assembly is kept with its changer it will not need recentering provided the alignment plates, one of which is shown in Figure 39, Item 3, are not disturbed. The assembly may be easily removed by disengaging all cable plugs and removing 3 mounting screws (Item 2). The screws (Item 4) should not be loosened. However, if a selector pin assembly should be mounted on another changer the alignment plates must be loosened. The pin assembly should be loosely mounted on the 3 studs and the centering clip (Fig. 40, Item 2) snapped in place on the selector crank arm (Item 1). Shift the pin assembly on its mounting studs to obtain a uniform clearance between the centering clip and all selector pins (Item 3). Tighten the alignment plate retaining screws and the mounting screws. Check the selector crank arm adjustments and for correct selection.

61672-6
3. Uniform Clearance at all Points

## 5. RECORD CHANGER ADJUSTMENTS

## a. SELECTOR CRANK ARM CLEARANCE ADJUSTMENT - 2400-2410

(1) Both tip and bracket assemblies at the ends of the selector crank arms on the 200 and the 100 selector crank arm assemblies should clear the tips of the selector latch pins in their latched position by $1 / 16^{\prime \prime}$ (Fig. 41, Item 1) as the crank arms are rotated. To vary this dimension the screw (Fig. 41, Item 5) may be adjusted. The 100 selection changer has this adjusting screw in the same location but is adjustable from the top end instead of the lower end.

Fig. 41. SELECTOR CRANK CLEARANCE ADJUSTMENT, 2400, 2410

9. Point of Maximum Actuation
10. Cancel Arm, Lower Assembly

59661
11. Tip and Mounting Bracket, Outer 110930
12. Point of Engagement, Tip and Latch Pin

With a selector latch pin released and the tip of the selector crank arm engaged with the released latch pin (Fig. 43, Item 12), advance the mechanism in its cycle until the peak of the cancel lobe on the main cam (Item 9) has depressed the cancel lever to its maximum stroke. In this position the selector latch pin should be reset with a $1 / 32^{\prime \prime}$ clearance under the head of the adjusting screw (Itern 8).

## d. CANCEL ARM ADJUSTMENT - 2404

The adjusting screw (Fig. 44, Item 5) should be adjusted with the mechanism in its normal rest position to provide $1 / 8^{\prime \prime}$ to $5 / 32^{\prime \prime}$ between the tips of the lower cancel arm (Fig. 44, Item 1) and the shoulder of the cancel sleeve (Item 2). The retracting spring (Fig. 44, Item 4) should be holding the roller of the cam follower (Fig. 45, Item 6) against the surface of the cancel cam.

Fig. 44. CANCEL LEVER ADJUSTMENT, 2404

| 7. Cancel Position of Main Cam |  |
| 8. Roller and Shaft Assembly | 59485 |

## e. RECORD LIFT ARM RETRACTED ADJUSTMENT

The record lift arms are driven down by a lobe on the main cam driving against the roller on the roller shaft, link and lever assembly (Fig. 46, Item 5). In their down position both lift arms should bear lightly against their lower stop brackets with approximately $1 / 4^{\prime \prime}$ clearance between the lower edge of the record carrier separators and the top edge of the guide tips on the upper end of the lift arms. Should adjustment be required check that the mechanism is in normal rest position. Loosen the set screw (Fig. 46, Item 4), loosen the lock nut
(Item 3), turn the adjusting screw (Item 2) until the arms rest lightly against the lower stop brackets. Tighten the locknut and set screw. Recheck the arms for the required position.

## f. ROLLER GUIDES - RECORD LIFT ARMS - 2400

(1) The roller guides for the record lift arm spring loaded guide tips are mounted on top of the chassis mounting plate. When the arms are down the guide tips are held straight in line and centered between the guide rollers. The adjustable bearing (Fig. 47, Item 11) should be set to provide $.003^{\prime \prime}$ to $.006^{\prime \prime}$ clearance between the guide tips and the rollers. Advance the mechanism in its cycle
and allow the lift arm to travel to a position where the guide tips are out of the record separators. Stop the mechanism at this point and measure the opening between the guide tips (Fig. 48, Item 1). The inside dimension should be $7 / 16^{\prime \prime}$.

| 12. Retaining Ring | $73724-25$ |

## (2) ADJUSTABLE PLATE SETTING

The adjustable plate (Fig. 47, Item 4) should be located with the slot centered between the guide rollers. Advance the mechanism in its cycle until the lift arms are free to raise and lower. The guide tip bearing pin must enter and leave the slotted guide plate (Item 4) with no bind and the tips should stand straight entering the record holder. The guide tips spread evenly as they leave the guide rollers. Should they run off to one side they may be straightened by loosening the retaining screw (Item 7) and moving stop bracket (Fig. 48, Item 5).

## g. RECORD LIFT ARM BRACKET AND ROLLER ASSEMBLY

The bracket and roller assemblies are mounted and located with a locating fixture at the factory after which scribe marks are made around the bracket. The scribe marks will be a guide in relocating the bracket should it be moved for any reason.

## h. ROLLER GUIDES - LIFT ARMS 2410 AND 2404 SELECTOR

The stationary guide rollex (Fig. 49, Item 4) should be set so that the roller rides squarely against the lift arm. The spring loaded roller should be set to allow smooth free travel of the lift arm up and down between the rollers.

## i. RECORD LIFT ARM HEIGHT ADJUSTMENT ADJUSTMENT

The record lift arm height adjustment may be made by stopping the mechanism in play position with a normal size record (6-7/8" diameter) clamped on the turntable. Back out the adjusting screw (Fig. 50 , Item 2) until the lift arm drags on the edge of the record. Make a scribe mark on the screw head and turn the screw in four full turns. The clearance between the edge of the record and the end of the record lift arm should be $3 / 32^{\prime \prime}$. Both lift arms should be checked.

Fig. 50. LIFT ARM HEIGHT ADJUSTMENT

[^0]
## j. RECORD TRACK STOP BRACKET ADJUSTMENT

The record track stop adjustment may be made by stopping the mechanism in its play position with the normal size record clamped on the turntable. Loosen the bracket mounting screws (Fig. 51, Item 3) and insert a nickel between the flipper (record track) (Item 5) and the stop bracket (Item 2). Slide the bracket back until the flipper just touches the edge of the record. Tighten the screws and remove the nickel. Both stop brackets should be similarly adjusted.

Fig. 51. RECORD TRACK STOP BRACKET ADJUSTMENT

1. Gauge, Nickel
2. Stop Bracket

73533-3
4. Point of Contact
5. Record Track, Flipper 59425

## k. RECORD LIFT ARM CENTERING ADJUSTMENT

The record lift arms on the 200 selector mechanism differ from those on the 100 or 104 mechanism in that they run free of the guide rollers until the arms are nearly at maximum height, at which time the ramp on the lower end of the arms contacts the adjustable guide roller bracket on the under side of the chassis (Fig. 52, Item $1 \& 3$ ). The ramp should enter and leave the rollers freely, with a clearance of $.005^{\prime \prime}$ maximum. This dimension may be adjusted while the lift arm is in its play position by loosening the locking screw in the eccentric stud (Item 2) and turning the stud to the correct clearance and tightening the screw. With the mechanism still in its play position clamp a flat record on the turntable and check the alignment of the record with the record lift arm (Fig. 53, Item 4). Should adjustment be required, turning the adjusting screw (Fig. 52, Item 6) will center the lift arm with the record. The 100 and 104 mechanism lift
arms are in contact with the guide rollers at all times. The above alignment has been factory set by forming and should need no adjustment.

Fig. 52. LIFT ARM CENTERING, 2400

6. Screw, Lift Arm Centering Adjustment 73660-161
7. Spring 65958

1. BACK STOP PAWL ADJUSTMENT, 2400

The two back stop pawls are located on top of the chassis mounting plate to the right and left of center at the rear. Each of the back stop pawls will be adjusted independently. However, the adjustment procedure will be the same in both cases. Before proceeding with adjustment of the back stop pawls, the record changer should, otherwise, be in good running order.
(1) Slightly loosen the two mounting screws (Fig. 58, Item 2).
(2) Turn the record carrier slowly until the center line of one of the record compartments is in accurate alignment with the left hand record lift arm as shown in Figure 54. Carefully maintain this condition of alignment and set the left hand back stop pawl to engage with the adjacent tooth of the index wheel. The depth of engagement should be $1 / 32^{\prime \prime}$ to $1 / 16^{\prime \prime}$ as shown in Figure 58. Tighten the mounting screws. Alignment of the record compartments with the record lift arms must be kept within a tolerance of $1 / 32^{\prime \prime}$.

Fig. 53. RECORD LIFT ARM CENTERING ADJUSTMENTS

1. Bumper, Inner, Record Guide

59396
2. Record Disc, on Turntable
3. Record Guide Plate

111044
4. Center Line, Record Lift Arm
5. Bumper, Outer, Record Guide, Re-designed

117254
(3) The right hand back stop pawl should be set in the same manner as stated in steps (1) and (2) above.
(4) The same procedure will be followed to adjust the back stop pawls on the 2410 .
(5) The back stop pawls on the 2404 are located at the front of the chassis mounting plate to the left and right of the center. The adjustment procedure will be the same as described for the 2400. Figure 56 shows one compartment of the record carrier located on the center line with the left hand record lift arm. This aligment should be checked at eight sectors of the record carrier.

## NOTE:

Whenever back stop pawls are readjusted the selector crank arm adjustments must be checked for correct operation.

Fig. 54. CENTER LINE FOR BACK STOP PAWL SETTING
m. ACTUATING SCREW, PLUNGER RELEASE ADJUSTMENT, 2404
(1) Turn the power off.
(2) Make sure that the reversing switch actuating plunger is latched in its down position by manually depressing the upper cancel arm (Fig. 44, Item 6).

Fig. 55. BACK STOP PAWL DEPTH ENGAGEMENT

1. Dimension $1 / 32^{\prime \prime}$ to $1 / 16^{\prime \prime}$. Tip of Tooth to Face of Pawl
2. Tip of Tooth
(3) Release an odd number selector pin for the left hand back stop pawl. The selector pin chosen should stop the selector crank in a convenient position for adjustment.
(4) Turn the record carrier slowly by hand until the selector crank arm just touches the released pin.

Fig. 56. CENTER LINE FOR BACK STOP PAWL SETTING 1. Center Line
2. Mounting Screws 73676-46
3. Guide Tip, L.H., Record Lift Arm

60711

61484

Fig. 57. ALTERNATE POSITION, RECORD LIFT ARM, FOR BACK STOP PAWL SETTING, 2410, 2404

[^1](5) Adjust the actuating screw (Fig. 59, Item 2) so that the plunger latch releases the reversing switch plunger when the correct tooth, as selected, has overtraveled the back stop pawl a distance of $1 / 16^{\prime \prime}$ to $3 / 32^{\prime \prime}$ (Fig. 58, Item 1).

Fig. 58. BACK STOP PAWL OVER-TRAVEL

1. Dimension $1 / 16^{\prime \prime}$ to $1 / 32^{\prime \prime}$ Over-travel
2. Mounting Screws, Back Stop Pawl

73676-46

Fig. 59. PLUNGER RELEASE, ACTUATING SCREW ADJUSTMENT

1. Plunger, Release Arm

59572
2. Actuating Screw, Plunger Latch 73502-95
(6) Re-latch the reversing switch plunger by pressing down on the upper cancel arm (Fig. 44, Item 6) and release an even number selector pin to check the right hand back stop pawl. Check the position of the record carrier when plunger release occurs, in the same manner as described above.
(7) The timing between plunger release and back stop pawl engagement should be checked in eight different sectors of the record carrier. If the plunger release occurs too early, before the back stop pawl has engaged the correct tooth on the index wheel, it will result in wrong selections. If the plunger release occurs too late it may result in wrong selections by driving the index wheel far enough to engage the wrong back stop pawl and bind the selector crank arm against the selector pin. This may also cause the same selection to repeat.

Fig. 60. STOP SCREW ADJUSTMENT, PLUNGER RELEASE ARM

1. Adjusting Screw, Latch Stop 73502-97
2. Stop Tab, Plunger Release Arm

## n. STOP SCREW ADJUSTMENT, PLUNGER LATCH LEVER, 2404

Make sure that the reverse switch latch plunger is in its latched position by pressing down on the upper cancel arm (Fig. 44, Item 6). Turn in the stop screw (Fig. 60, Item 1) until it touches the latch lever (Item 2). Hold the plunger latch lever against the stop screw while turning the screw out until the plunger is released. Turn the screw out an additional $1 / 2$ turn for overtravel. Check this adjustment by releasing an odd number selector pin. Manually turn the record carrier until the selector crank arm engages the released pin and releases the latch plunger. Continue rotating the record carrier by manually turning the changer motor shaft clockwise until the plunger latch lever (Fig. 60, Item 2) is held firmly against the stop screw (Item 1) by the actuating screw. The overtravel between the left hand back stop pawl and the correct tooth on the index wheel should be $3 / 16^{\prime \prime}$ maximum.

Fig. 61. KICK-OFF SCREW ADJUSTMENT

[^2]
## o. KICK-OFF SCREW ADJUSTMENT, 2404

The adjusting screw (Fig. 61, Item 1) for centering of the selector crank arm is mounted on the end of the "adjusting bracket and stop nut assembly" opposite the plunger latch stop screw and actuating screw. This screw provides adjustment of the selector crank "at rest" position, to avoid interference with the release of adjacent selector pins (Fig. 62, Item 2).

Fig. 62. SELECTOR CRANK ARM CENTERING

1. Center Line
2. Selector Pins

64606
(1) With the plunger latched in its "down" position, release any convenient selector pin.
(2) Turn the record carrier slowly, by hand, until the selector crank is stopped by the released pin and the reversing switch plunger is released.
(3) Make sure the corresponding tooth of the record carrier engages its backstop pawl at this point, and is held firmly against it.
(4) Cancel the selected pin by pressing down on the cancel lever (Fig. 44, Item 6).
(5) Adjust the selector crank kick off screw (Fig. 61, Item 1) so that the tip of the crank arm rests midway between selector pins.

## p. ACTUATING SCREW ADJUSTMENT, CARRIAGE SWITCH, 2400, 2410

The 2400 and 2410 electric selectors use a reversing relay instead of two mechanically operated micro switches to reverse the changer motor. Therefore, the timing of the reverse relay will be controlled by the closing of the carriage switch (Fig. 63, Item 2).

Fig. 63. ACTUATING SCREW ADJUSTMENT, CARRLAGE SWITCH

1. Selector Shaft and Adjusting Plate Assembly 115669
2. Carriage Switch
3. Screw, Carriage Switch Adjusting 110557
73502-95
4. Switch Lever and Stop Nut Assembly 110937
5. Reverse Switch
6. Screw, Selector Crank Stop Adjustment
7. Stop Tab, Selector Crank (See Item 1)
(1) Proceed as on the 2404 by turning the service switch OFF, release an odd number (inner) selector pin, rotate the record carrier until the selector crank arm engages the released pin (Fig. 64 , Items $4 \& 12$ ). As viewed from the rear, manually turn the changer motor shaft clockwise until the reversing relay is heard to operate, at which point the right hand back stop pawl at the rear of the chassis mounting plate should have just dropped into engagement with a tooth on the index wheel. Allow overtravel of $1 / 32^{\prime \prime}$ maximum (Fig. 58, Item

Fig. 64. STOP SCREW ADJUSTMENT, SELECTOR CRANK

[^3]1). Check this adjustment at twelve positions around the pin assembly using inner odd number pins. At no point should there be more than $1 / 32^{\prime \prime}$ overtravel of the index wheel tooth past the back stop pawl at the moment the reverse relay operates.
(2) Check the left hand back stop pawl, as viewed from the rear of the phonograph, by releasing an outer (even number) pin. The timing between backstop pawl engagement and reverse relay operation should be identical. If not,do not adjust the actuating screw since it was adjusted to time the right pawl with inner pins. The tip and mounting bracket assembly which engages the outer pins may be adjusted to time the carriage switch action with the left pawl to synchronize with the right pawl. This adjustment should be checked at several positions around the pin assembly using outer (even number pins.

Fig. 65. ELECTRIC SELECTOR 2410

1. Micro Switch, Carriage

110558
2. Adjusting Screw, Carriage Switch Actuating 73503-72
3. Adjusting Screw, Stop 73503-91
4. Adjusting Screw, Kick-off 73503-93
5. Adjusting Screw, Selector Crank Clearance 73793-125
q. STOP SCREW ADJUSTMENT, 2400 and 2410

The stop screw serves to prevent momentum from driving the record carrier into the wrong selection. Check the setting of the stop screw (Fig. 64 , Item 11) by releasing an inner pin and rotating the record carrier manually until the reverse relay is heard to operate. Continue by turning the changer motor shaft clockwise until the stop screw (Item 8) is resting against the tab of the stop bracket. At this point there should be $1 / 16^{\prime \prime}$ to $3 / 32^{\prime \prime}$ maximum overtravel between the back stop pawl and the tooth of the index wheel (Fig. 58, Item 1).

## r. KICK-OFF SCREW ADJUSTMENT, 2400 AND 2410

Adjustment of the kick-off screw will be made with the index wheel held against a backstop pawl. The adjusting screw should be set to locate the tip (Fig. 66, Item 3) on the center line between the inner pin (Item 2) and the outer pin (Item 3). Check the alignment of the tip on the inner crank arm at twelve positions around the selector pin assembly and then the tip on the outer arm at twelve positions.

Fig. 66. KICK-OFF SCREW ADJUSTMENT

1. Screw, $10-32 \times 1$ ", R.H., Kick-off 73502-95 2. Selector Latch Pin, Inner 110941
2. Center Line of Bracket Tip
3. Selector Latch Pin, Outer

110942

## s. ACTUATING SCREWS, MICRO REVERSE SWITCHES, 2404

To adjust the reverse switches (Fig. 67, Item 1), turn the service switch OFF. Release any selector latch pin and rotate record carrier until selector crank arm engages selector pin and releases latch plunger. The reversing switch adjusting screws (Item 3) should travel $1 / 32^{\prime \prime}$ before the switches actuate. As the latch plunger is reset the adjusting screws should travel $1 / 32^{\prime \prime}$ before switch actuation.

## t. TRANSFER SWITCH ADJUSTMENT, ALL MODELS

Release a selector pin and let the mechanism advance in its cycle until the roller (Fig. 68, Item 5) has passed the cam lobe (Item 6). Turn off service switch and back out the adjusting screw (Item 4) until the insulating stud clears the switch actuator. Advance the mechanism through its cycle until the roller (Item 5) is again on the cam lobe (Item 6). Turn the power OFF and adjust the screw (Item 4) until the transfer switch is actuated over center by its toggle spring (Item 2). The adjusting screw should be turned 2 full turns beyond this point for overtravel. Check the mechanism through several cycles for proper switch actuation.

Fig. 67. REVERSING SWITCH ADJUSTMENT

1. Reversing Switches

61596
2. Switch Actuators
3. Adjusting Screws

73503-73

Fig. 68. TRANSFER SWITCH SETTING

| 6. Long Lobe on Side of Main Cam | 62792 |  |
| 7. Roller, Actuating Arm, Tone Arm | 56594 |  |

u. MUTE AND PLAY SWITCH ADJUSTMENT, ALL MODELS

The mute and play switch is actuated by the adjustable cam lobe (Fig. 69, Item 2). The timing marks (Item 1) should be in alignment. Advance the mechanism in its cycle until the roller (Fig. 70, Item 3) is at the base of the lobe still resting on the surface of the main cam. Adjust the stop plate (Fig. 71, Item 6) to meet the actuating arm at (Item 3) with a maximum of $1 / 64^{\prime \prime}$ clearance between the roller and the surface of the main cam (Fig. 70,

Item 2). Manually turn the changer motor shaft counterclockwise until the roller is on the peak of the adjustable lobe. Continue turning the changer motor shaft in the same direction and as the roller rides off the adjustable lobe the play switch should be adjusted to actuate with $1 / 16^{\prime \prime}$ overtravel of the switch tab (Fig. 71, Item 2).

Flg. 69. TIMING OF MUTE AND PLAY SWITCH

1. Timing Marks, Main Cam and Adjustable Cam
2. Adjustable Cam, Mute and Play Switch 62768
3. Locking Screws, Adjustable Cam 73534-14

Fig. 70. STOP PLATE SETTING, MUTE AND PLAY SWITCH 1. Mute and Play Switch Cam 62768
2. Zero to $1 / 64^{\prime \prime}$ Clearance, Stop Plate Setting
3. Roller, Actuator Arm, Mute and Play Switch

56592
Run the mechanism through several cycles to check for correct mute and play switch action. Observe closely for any forward movement of the record clamp cam (Fig. 7.2, Item 5) at the time the tone arm trip switch actuates or any return action of the cam at the time the play switch actuates to stop the changer in play position. Either condition existing requires readjustment of the play switch cam lobe (Fig. 69, Item 2).

73533-22

## v. TURNTABLE ADJUSTMENTS, ALL MODELS

(1) The turntable release arm (Fig. 72, Item 4) must be centered about the hub of the record clamp plate (Item 2). Loosening the mounting screws (Item 6) will permit allgnment of the rollers (Item 3).

Fig. 72. RECORD CLAMP SETTING

[^4]

Fig. 73. RECORD CLAMP SETTING

1. Equal Distance
2. Record Clamp Plate Clearance $1 / 32^{\prime \prime}$ to $1 / 16^{\prime \prime}$
3. Lock Nut

73601-10
4. Record Clamp Plate

63205
5. Record Clamp Plate Clearance $1 / 32^{\prime \prime}$ to $1 / 16^{\prime \prime}$
(2) With a record in play position on the turntable, shut the power off. Pull back the clamp plate (Item 4) and loosen the locknut (Item 3). Release the clamp plate slowly to play position and adjust the clamp plate on the threaded clamp rod to provide $1 / 32^{\prime \prime}$ to $1 / 16^{\prime \prime}$ clearance (Fig. 73, Items 2 and 5) between the rollers and the clamp plate. Tighten the locknut. Manually return the record clamp cam (Fig. 72, Item 5) to its normal rest

Fig. 74. TURNTABLE PILOT SETTING

1. Clearance $1 / 32^{\prime \prime}$ to $1 / 16^{\prime \prime}$
2. Turntable Pilot
3. Turntable

59449 68033
position and check the clamp rod for additional travel. The clamp rod must not jam in rest position, but should return far enough to retract the turntable pilot $1 / 32^{\prime \prime}$ to $1 / 16^{\prime \prime}$ inside the turntable assembly (Fig. 74, Item 1).

Fig. 75. TURNTABLE DRIVE GEAR ADJUSTMENT

7. Motor

115058
8. Drive Gear

65203
(3) The turntable table drive gears (Fig. 75 , Items 5 and 8) are adjustable for alignment and mesh. The motor and mounting plate assembly may be removed from the top support casting by disconnecting the line plug (Fig. 76, Item 3) near the tone arm trip switch. Two lock nuts (Item 6) hold the mounting plate to the two top rubber mounts and a retaining ring (Item 9) holds the bottom stud. With the motor and mounting plate removed the motor may be shifted on the mounting plate by loosening the three screws (Fig. 75, Items 3 and 6) to center the worm gear over the nylon pinion gear and to mesh sufficiently for free running with a minimum of back lash. The thrust spring (Fig. 75, Item 4) should bear against the steel ball in the end of the worm gear with a pressure of $2-1 / 2$ to $3-1 / 2$ ounces. The gears and motor bearings should be well lubricated as indicated in the maintenance instructions.
(4) The turntable drive pulley is mounted on the driver gear shaft with an allen set screw (Fig. 76, Item 10). The pulley should be mounted on the shaft to allow approximately $.006^{\prime \prime}$ end play.

Fig. 76. TURNTABLE MOTOR MOUNTING AND BELT ADJUSTMENT

73724-25
11. Contact

73513-19
(5) The turntable drive belt tension is adjustable by loosening the stud (Item 4) and the screw (Item 1). The upper motor mounting bracket (Item 2) may be shifted on its elongated mounting holes.

Fig. 77. TONE ARM FEED-IN ADJUSTMENT
$\begin{array}{llr}\text { 1. Tone Arm Stop Pin Assembly (Feed-in Adjusting) } & 115660 \\ \text { 2. Tone Arm Latch } & 64423\end{array}$
3. Feed-in Start Position
w. TONE ARM ADJUSTMENTS, ALL MODELS
(1) The tone arm feed in adjusting screw (Fig. 77, Item 1) is set at the factory using fixture X42226 (Item 3) and should need no adjustment. However, when a readjustment is required it may be accomplished by advancing the record changer in its cycle until a record is clamped on the turntable. Turn the service switch off before the needle contacts the record and adjust the feed in screw (Item 1) to position the needle in the feed-in groove of the record. The setting should be $2-5 / 8^{\prime \prime}$ to $2-11 / 16^{\prime \prime}$, measured from the outside circumference of the turntable pilot to the needle, to conform with R.I. A.A. standards.
(2) Tone arm latch bracket adjustment should be accomplished with a perfectly flat record in play position, the tone arm free from the latch bracket ready to play. The feed-in adjusting screw should be centered within the latch bracket (Fig. 78, Item 3). If adjustment is required, turn the adjusting screw (Item 5).

Fig. 78. TONE ARM LATCH LEVER ADJUSTMENT

1. Record
2. Needle, Cobra 57525 Stereo 116727
3. Dimension, Equal Each Side
4. Tone Arm Release Bracket 116921
5. Adjusting Screw 64427
6. Tone Arm Latch Bracket 64423
7. Stop Pin, Tone Arm Feed-in 115660
(3) Needle pressure adjustment may be accomplished by turning the stop nut (Fig. 79, Item 3) to vary the spring tension on the tone arm. With a record in play position and the power off, use a gram scale such as Graybar 70-D, measuring, at the end of the tone arm, the pressure needed to just pull the needle off the record (Fig. 79, Items 1 and 2). The recommended needle pressure on the "Cobra" pick up should be 10 to 12 grams and on the Sonotone Stereo needle it should be 4 to 5 grams.

Fig. 79. NEEDLE PRESSURE ADJUSTMENT

1. Gram Scale
2. Tone Arm, Free for Compliance

116142
3. Stop Nut, Needle Pressure Adjustment

73865-8
(4) Tone arm balance adjustment should be accomplished with the mechanism in play position, no record on the turntable and the service switch off. Using a piece of thread (Fig. 80, Item 3) tie the tone arm in a position where the latch bracket (Item 2) clears the feed in screw (Item 1). Using a gram scale such as Graybar 70-D measure at the pick up end, the pressure needed to move the arm in either direction: i.e. up or down. When correctly balanced by the adjusting screw (Item 6) the arm should move with no more than 1 gram pressure at any position in its swing. If a gram scale is not available a light puff of air should move the arm.
(5) The tone arm trip switch (Fig. 81, Item 9 ) is adjustable by means of the screw (Item 10) and actuated by the bracket (Item 6). The switch is adjusted at the factory to R.I.A.A. standards which allows for extended play records. Due to the wide variations in records it may be necessary to readjust the trip switch. This may be done by measuring $1-1 / 4^{\prime \prime}$ to $1-5 / 1^{\prime \prime}$ from the edge of the centering hole in a standard record and marking. Place the record in the record carrier and select the marked side. Adjust the trip switch screw (Item 10) to produce switch action when the needle is on the mark.

Fig. 80. TONE ARM BALANCING ADJUSTMENT

1. Stop Pin Assembly, Tone Arm Feed-in 115660
2. Latch Bracket, Tone Arm 64423
3. Thread, Tie Down
4. Stop Nut, Tone Arm Balance

23879
5. Balancing Weight and Bracket Assembly 65273
6. Screw, Balance Adjustment 73575-100
(6) The tone arm needle brush adjustment should be accomplished with the phonograph in its normal at rest position. The needle brush (Fig. 82, Item 4) should be $1 / 4^{\prime \prime}$ to $1 / 2^{\prime \prime}$ below the cartridge. The dimension may be varied by loosening the mounting screws (Fig. 83, Item 1) and moving the idler wheel. The needle brush is actuated by the action of the transfer switch causing the brush to sweep across the tip of the stylus. The tip of the stylus should project into the brush a depth of $1 / 32^{\prime \prime}$ (Fig. 82, Item 5). The brush mounting bracket may be formed to provide the correct wiping action.' Use care in adjusting the wiping action to avoid damage to the cartridge. Removal of the silicone damping grease between the stylus and the cartridge housing will result in poor tone quality.

## x. CHANGER MOTOR PINION GEAR MESH

The changer motor pionion gear (Fig. 84, Item 4) mesh is adjustable by loosening the two mounting screws (Item 1). The motor and mounting bracket assembly (Item 2) may be shifted to provide minimum back lash between the pinion gear (Item 4) and main drive gear (Item 5) with no bind.

Fig. 81. TRIP SWITCH SETTING

1. Record Disc

## y. ACTUATING ARM AND CABLE ADJUSTMENT

The actuating arm and cable adjustment for the turntable and tone arm (Fig. 85) should be made with the mechanism in play position. Set the adjusting screw (Item 9) so that the roller (Item 6) just rests against the stop wall of the cam with no slack in the cable (Item 7).

| 10. Actuating Arm | 59688 |
| 11. Slide Pin | 59686 |

## 6. MAINTENANCE

## a. INSTALLATION OF NEW TURNTABLE ACTUATING CABLE

(1) To install a new cable for the turntable actuating shaft assembly, pass the cable (Fig. 86, Item 2) through the hole in the drive pulley (Item 3) and form a loop at each end of the cable $3 / 4$ of an inch long, clamping with sleeves (Items 1 and 4). Locate the cable in the pulley to conform to the dimensions shown at (Items 6 \& 7) and lock securely with the set screw (Item 5).
(2) Remove the two screws holding the stop plate on the turntable cam (Fig. 85, Item 2) to allow the cam to rotate counterclockwise, as viewed from the rear, far enough to hook the lower loop in the cable over the slide pin (Item 11). The cable should pass over the idler pulley (Item 8).

Fig. 86. TURNTABLE CABLE AND DRIVE PULLEY

| 6. $63 / 16^{\prime \prime}$ From Center Line to Inside of Loop |  |

7. $187 / 8^{\prime \prime}$ From Center Line to Inside of Loop

The upper end of the cable will pass once around the drive pulley (Item 1) and hook to the spring (Item 5). The free length of the spring should be approximately $3-1 / 2^{\prime \prime}$. Replace the roller of the release lever (Item $\oint$ ) back of the cam and replace the stop plate (Item 2).

## b. SHIM PROCEDURE FOR ASSEMBLING TURNTABLE SHAFT

Following installation of the thrust bearing group (Fig. 87, Items 6, 7 and 8) against the turntable, three fiber washers (Items 9, 11 and 13) and two metal washers (Items 10 and 12) should always be installed on the turntable end of the shaft. They should be installed starting with a fiber washer, a metal washer next, then a fiber, a metal and ending with a fiber. The turntable shaft is installed in the sleeve and bushing after which the shim washers are installed at the fly wheel end starting with a fiber washer and ending with a fiber washer alternating with metal washers until the shaft end play is within $.008^{\prime \prime}$ to $.013^{\prime \prime}$. After assembly the bearings should be well oiled with S.A.E. 10 motor oil.

## c. LUBRICATION

The turntable motor bearings should be lubricated every three months with a good grade motor oil S.A.E. 10. Complete lubrication of the entire mechanism should be done every six months in accordance with the following instructions.
(1) Houghton Absorbed Oil, Type L-3, part number 21934 A , should be used at points where a non-fluid type lubricant is required such as: The main cam working surfaces (cam tracks), gears and pinions, turntable worm gear and pinion, spring anchor points and the bearings of heavy linkage.
(2) A good grade motor oil, S.A.E. 10 , should be used on all light weight linkage and lever bearings and the following points: Record lift arm guide roller bearings, the annular bearings under the record carrier, turntable drive shaft and motor bearings, the main cam shaft, the tone arm actuator shaft assembly, the record carrier shaft, the turntable sleeve bearing, the center bearing of the changer motor.
(3) To oil the record lift arm bearings turn the record carrier until the half inch hole, located one and a half inches off center in the carrier casting is directly in front. At this position the half inch hole will align with a hole in the chassis mounting plate. Oil through the two holes will be absorbed by a felt pad which will lubricate the record actuator arm bearings.
(4) The reduction gears of the changer motor assembly are packed with a non-fluid lubricant (Alvania No. 1), part number 55206A and should require no further lubrication. However the center bearing of the changer motor, provided with an oiler on the top, should be oiled every six months.

## d. CLEANING

(1) Electrical contacts are nominally made of silver and are therefore, quite soft. Cleaning should be done with a burnishing tool made expressly for the purpose or a strip of heavy bond paper.
(2) To maintain the inherent customer play appeal it is advisable to periodically clean the phonograph inside and out. The decorative background and the Dinoc sides of the cabinet may be wiped down with a mild soap and warm water. The plastic plate on the record guide assembly should be cleaned with an antistatic cleaner. Use caution in cleaning to avoid damage to the stylus. The front door glass should be cleaned with clear water.

## e. REPAIRS TO FINISH

The side panels of the cabinet are clear lacquer finished over a "Dinoc" dry strip transfer which may be ordered as needed (part number 116647). The piece is used either on right or left side and will be trimmed to fit. The upper side plate is also covered with a "Dinoc" dry strip transfer and may be ordered by part number 116594, R.H. or 116596 , L.H.
(1) Minor scratches and abrasions, not into the wood, may be treated directly with a touchup brush and colors lifted from a piece of the Dinoc transfer. Thoroughly clean the surface to be repaired to remove any wax or foreign material. Dip the touch-up brush in undiluted welding solution (A1171) and lift the color desired from a patch of the transfer. Blend into area to be repaired. Allow each color to dry before applying the next one. After thoroughly drying, the area should be sprayed with satin finish clear lacquer (Inter Chemical 12575 Water White) or equivalent. Do not use a brushing lacquer.
(2) When major repairs are to be made fill deep scratches and uneven areas with lacquer glazing putty and allow to dry for one half hour. Sand to a perfectly smooth surface. If the sanding operation cuts through to the bare wood, spot spraying with clear lacquer must be done to seal the. wood pores from the moisture of the welding solution. Air dry the lacquer spray. Using a repair panel (116647) select and cut out a section to match the grain at the repair area. Lift the transfer from the backing. Sandpaper is effective for starting.
(a) Sponge the repair surface liberally with clear water and apply the selected section of transfer. The presence of the water will permit sliding of the transfer to match up the grain.
(b) When properly positioned, sponge the surface of the transfer to provide slippage for squeegee gperation to remove excess water.
(c) Pick up one corner of the transfer and roll it back until approximately one half of the repair surface is exposed. Sponge on a liberal coat of diluted (4 parts water to 1 part A1171) welding solution and lay the transfer back in position.
(d) Keeping the surface of the transfer wet with water begin squeegeeing from the center to the outer edges, using firm overlapping strokes to remove all air bubbles and excess welding solution.
(e) Roll back the other half of the transfer until adhesion of the first half can be detected, and proceed in the same manner as above. The squeegeeing operations should always be done with short, firm, overlapping strokes on a surface well moistened with water.
(f) Wash the surface thoroughly with water to remove all excess welding solution and prevent marking the finish. Should any bubbles appear, slice them with a razor blade and press out the air or welding solution. Repeat washing.
(g) Allow the panel to air dry over night before spraying with satin finish clear lacquer as mentioned under minor repairs.

## f. INSTALLA TION INSTRUCTION

(1) In removing the shipping cleats and the various "tie-downs", carefully note the instructions on the respective tags. These tags will be found at the important "tie-down" points for your convenience in unpacking and as a guide for preparation of the phonograph when it is again trucked. It is very important that the wooden strips be reinstalled under the record carrier and the four chassis "hold-down" thumb screws be tightened during any transportation. It is recommended that the "tie-wires" through the 'hold-down" thumb screws be saved and reinstalled before transporting the phonograph. During operation, the chassis "hold-down" thumb screws should be completely unscrewed from the chassis. They are provided with retainers to keep them in the mounting brackets. The chassis should set squarely on its four mounting springs and float freely all around.
(2) Do not expose the phonograph to direct sunlight or place in close proximity to hot radiators or space heaters. Excessive heat inside the cabinet will warp the records, resulting in unnecessary service calls.
(3) It is recommended that all cables entering the phonograph be made long enough to permit the phonograph to be moved far enough for ease in servicing and floor cleaning. Service calls will be reduced if the cables are neatly formed and held off the floor by a suitable hook on the rear door of the phonograph.
(4) A level footing should be provided for the phonograph to insure correct operation of the coin mechanism. Should leveling be necessary it may be accomplished by removing the caster where height is required and installing $7 / 16^{\prime \prime}$ iron washers over the caster pin. Replace the caster and check the phonograph for correct coin operation.
(5) Do not over fuse the electrical circuits. Doing so may result in severe damage to the power supply. Should trouble develop in the low voltage circuits it is suggested that a test lamp be used in checking the circuits instead of over fusing. A convenient test lamp can easily be made with the following parts:

1 - Cap for fuse post
1 - Blown bus fuse
1 - Lamp socket for,
1-G.E. \#305 lamp
2-4" lengths of plastic coated \#20 stranded wire

The steps in assembling the test lamp follow:
(a) Drill through the center of the fuse cap using a number 18 drill.
(b) Drill a hole in the center of each ferrule on the blown fuse using a number 36 drill.
(c) Solder one of the wires to the end of one ferrule being careful to keep the hole clear.
(d) Pass the other wire through both ferrules and solder to the end opposite the first wire soldered in step (c).
(e) Pass both wires through the fuse cap and solder to the socket terminals.
(f) Insert the G.E. \#305 lamp in the socket.
(g) Plug the test assembly into the fuse holder of the particular low voltage circuit to be tested. If the circuit is shorted or grounded the lamp will light to full brilliance. If the circuit is normal the lamp will light at partial brilliance or not at all.

## 7. 259 STEPPER ASSEMBLY

## a. GENERAL

The stepper assembly (Fig. 88) used with the 2410 and 2410 phonographs is mechanically similar to the stepper used with the 2400 and 2400 S phonographs. The electrical circuits are wired as shown in the functional schematic, 116402 and the
wiring diagram, 116847, in the schematic section of this manual. Should it be desired to use this stepper with a 2410 or 2410 S phonograph purchased without stepper the model 259 stepper (Part No. 117106) may be installed. Instructions for installation are contained with the assembly.

## b. OPERATION

The stepper unit is provided with a numbered terminal strip (Item 3) for connecting the three conductor cable to the wall boxes. Number three terminal is the 24 volts A.C. fused by the 3 ampere fustat (Item 5). This circuit will accommodate four

5200 or 5202 Wurlitzer wall boxes. If more boxes are required a Model 222 booster power supply should be installed which will accommodate four additional wall boxes. A Model 222 booster should be used for each additional group of four wall boxes. The number two terminal is grounded and is a common circuit for the 24 volt a.c. return and the impulse circuit. Number one terminal is the impulse circuit which when closed to ground by the rotary contact arm in the wall box will pulse the relay (Item 2). The two sets of contacts on the pulse relay close the ground through two sets of normally closed contacts on the transfer relay (Item 10) to the number step magnet (Item 28) and the number timing relay (Item 14). The contacts on the number step magent (Item 28) close on the first pulse to energize the latch relay (Item 21). The latch relay serves to hold the step up ratchet wheels in position as they are rotated by the step up magnet and its associated pawl. At the completion of the number pulses from the wall box the number timing relay will release while the latch relay is delayed in releasing by the 250 mfd . capacitor (Item 11) discharging through its winding. During this interval the transfer relay will be energized through a normally open contact on the latch relay (closed at this time).

The first letter pulse from the wall box will now close the pulse relay (Item 2) and its contacts closing, complete the circuits through the normally open transfer relay contacts, at this time closed, to energize the letter step magnet (Item 27) and the letter timing relay (Item 13). The letter pulse relay (Item 9) will be energized by a pair of contacts on the letter timing relay (Item 13). The operation of the letter pulse relay closes a pair of contacts to hold the latch relay until the wall box completes its selection cycle. Pulsing of the letter step magnet rotates the letter ratchet wheel and contact wiper to a position determined by the number of letter pulses received from the wall box. After completion of the wall box cycle the letter timing relay releases completing the selection circuit from ground through contacts on the letter pulse relay (Item 9), contacts on the latch relay (Item 21), contacts on the number timing relay (Item 14) through the stepper rotary contact arm to energize the driver solenoid which positions the rocker plate assembly in the selector drum to the proper number position. The second wiper arm of the number pulse rotary contact wiper isolates the a.c. selection circuits for selector coils one to five or six to ten. The 24 volt a.c. circuit is completed through contacts on the letter timing relay (Item 13), contacts on the letter pulse relay (Item 9), a rotary contact wiper on the number pulse step up unit, a rotary contact wiper on the letter pulse step up unit and then to the selected letter coil. The letter coil circuit is fused through the $8 / 10$ ampere slow-blow fuse mounted on the junction box.

## 8. SOUND SYSTEM

## a. MONOPHONIC SOUND SYSTEM

(1) The 2400 series monophonic phonograph sound system (Fig. 89) consists of a Model 536 single channel amplifier (Item l) with built in "automatic level control", low inertia tone arm (Item 5) with Zenith "Cobra" pick-up, and a high fidelity speaker and cross-over network (Items 2, 4 and 6). The speaker compliment consists of one $12^{\prime \prime}$ p.m. heavy duty, one $12^{\prime \prime}$ p.m. mid-range and one $7^{\prime \prime}$ p.m. high frequency.

Fig. 89. SOUND SYSTEM - MONOPHONIC

| Amplifier, 536, Less Tubes | 113153 |
| :--- | ---: |
| Speaker. 7 " | 114054 |
| Cover, $7 "$ Speaker | 114058 |
| Speaker, $12^{\prime \prime}$ Heavy Duty | 114006 |
| Tone Arm Assembly | 116142 |
| Speaker, $12^{" M}$ Mid Range | 65192 |
| Input Cable Assembly | 110190 |

The out-put of the Model 536 Amplifier is provided with 8 Ohm terminals and C. V. terminals with a ratio fader control for use when auxiliary speakers are used in conjunction with the phonograph. Remote volume control together with cancel facilities is available by use of Kit 147 (Part Number 65337).
(2) The low inertia tone arm is balanced as described under Figure 80. The Zenith Cobra pick-up provides maximum efficiency in the conversion of record modulation to electrical impulses with a minimum of needle and record wear.
(3) The Model 536 amplifier is slide mounted on the inside left panel of the phonograph cabinet to provide good accessibility. The main line switch, the manual reject switch, the volume control and the fader switch are mounted on the rear end of the amplifier chassis accessible through the opening along the left edge of the lower back door. Also mounted on the rear of the amplifier chassis, but only accessible when the lower back door is removed, is the auxiliary speaker terminal strip and the service outlet with a maximum rating of 4 amperes.
(4) Mounted along the top side of the amplifier chassis will be found the single prong input socket, a six prong mute switch socket, a single prong socket for connecting an auxiliary amplifier, treble and bass controls and a socket for connecting a remote volume control. The amplifier chassis is also provided with a double single prong socket for connecting the cabinet speakers, an outlet for connecting the cabinet lights and fuse holders for the $2 A . D . C$. fuse, the $2 A$. line fuse for the amplifier, the 8 A . fuse for the 24 V . A.C. circuits and the 15 A . main line fuse. There is one eleven prong socket for connecting the electric selector to the amplifier. The A.C. and D.C. power for the phonograph is supplied by components on the amplifier chassis.
(5) The types and functions of the amplifier tubes are listed in the following table.

## TYPE

| 1-12AU7 | Twin Triode |

b. THEORY OF OPERATION, 536 AMPLIFIER

The cobra pickup operates in conjunction with an oscillator using a section of the 12AU7 tube shown in the schematic on pages 43-44 of this manual. The frequency is approximately 2.5 megacycles. As the stylus and vane of the pickup responds to variations in the record groove it is moved toward and away from the small coil in the pickup cartridge which is part of the oscillator circuit. This movement of the stylus and vane amplitude modulates the oscillator, since power is absorbed by the vane when closest to the coil the vane absorbs the most power thereby reducing the amplitude of oscillation, and when farthest away from the coil the vane absorbs the least power allowing the amplitude of oscillation to increase.

Fig. 90. MODEL 536 AMPLIFIER, LESS TUBES
The oscillation ( 2.5 MC ) taking place does so over a curved portion of the current-voltage characteristic of the 12AU7 section. As a result detection of the modulated oscillation is obtained, and the output voltage appearing at the plate of the tube contains the 2.5 MC and the audio frequencies of the record. By means of C-6 (100MMF) capacitor
the 2.5 MC is filtered out, but the audio frequencies are not attenuated and they pass through the various stages of the amplifier.
(1) Referring to the block diagram (Fig. 91) it will be seen that a portion of the signal is taken from the voltage amplifier section of the 6AN8 and amplified by the first section of the 12AX7 tube. The above D.C. voltage therefore varies with the level of the record being played. This action then is used to compensate for differences in levels of various records causing low level records to be raised in volume as the signal passes through the first section of the 6AN8 while high level records will be cut down. Between the second section of the 6AN8 and the 6AU6 the signal level is set by the loudness control passing on to the 12AX7 phase inverted which drives the two 6L6GB tubes in a push-pull output system. Constant voltage output is obtained by use of the variable negative feed-back from the secondary of the output transformer. It compensates for various auxiliary speaker loads and permits maximum output with minimum distortion.
(2) During record changing intervals the amplifier is muted by the mute and play switch shown in Figures 70 and 71. It consists of one double pole, single throw switch; one single pole, double throw switch and one single pole, single throw switch mounted on a bracket at the rear of the changer and operated by a lever and an adjustable lobe on the main cam. The left hand set of contacts, as viewed from the rear is the double pole, single throw section, which shunts the audio signal between the 6AU6 and the phase inverter 12AX7. The other contact of this left hand section is used on the Model 538 stereo amplifier to mute the second channel. On the 536 monophonic amplifier the two mute contacts are tied together at pins one and six of the mute switch socket.

Fig. 91. MODEL 536 AMPLIFIER BLOCK DIAGRAM FOR SIGNAL TRACING.

NOTE: For Code Values See Schematic Diagram 114317-3
Fig. 92 PRINTED CIRCUIT BOARD - MODEL 536 AMPLIFIER (TOP SIDE )

| . Input Cable Assembly (2) |  |

(3) The center set of contacts forming the single pole double throw section serves to stop the changer motor when the record is in play position and to close a dynamic brake circuit across the motor armature.
(4) The right hand set of contacts are normally closed and places a D.C. voltage to the time constant circuit of the automatic level control reducing the output during record changing phases. The switch opening at play position allows a gradual build-up in signal strength to the pre-set level of the manual loudness control.
(5) Current for the heater elements of the amplifier tubes is supplied from two separate power transformers. The filament windings of these transformers are connected in series and in phase. When in stand-by condition the power transformer (T-1) shown on wiring diagram 116396-2 is not energized, however the junction power transformer ( $\mathrm{T}-2$ ) is on
at this time providing partial heater current to the tubes. When a selection is made transformer (T-1) becomes energized through the contact closing on the over-ride relay quickly bringing the amplifier tubes to normal temperature for playing as soon as a record is in play position.

## c. STEREO SOUND SYSTEM

The stereo dual channel amplifier (Fig. 95) operates in conjunction with the Sonotone stereo pick-up, therefore it will be noted by referring to the block diagram (Fig. 98) that the radio frequency oscillator employed with the 536 amplifier is not used. The audio signal from both circuits of the Stereo Cartridge is fed directly to the grids of the 7025 tubes of Channel A and Channel B.

Fig. 95. MODEL 538 STEREO AMPLIFIER, LESS TUBES 116181
(1) THEORY OF OPERATION
(a) The signal is amplified in the first section of the 7025 tubes after which a portion is taken from channel A and fed to the voltage amplifier section of the 12AX7 tube. The second section of the 12 AX 7 rectifies this audio signal resulting in a varying D.C. voltage which is applied to the time constant circuit at the grids of the variable resistance section of both 12AU7 tubes. Thus the signal from channel $A$ is used to control the level of both channel A and B. After passing through the cathode follower section of the 7025 tubes the loudness, control governs the output of the amplifier. The tone controls on both channels are wired between the voltage amplifier section of the 12 AU 7 tubes and the 12AX7 phase inverters.
(b) The balance control, common to both channels, is wired between the input grids of the $12 \mathrm{AX7}$ phase inverters and serves to equalize the output level between channel A and B. It should be adjusted, after auxiliary speakers have been connected, by listening to a monophonic record. Good stereo reproduction requires that the channels be balanced.
(c) The 12AX7 phase inverters drive two 6973 output tubes in a push pull circuit providing 18 watts of power at each channel. A variable feed-back circuit is employed, as on the 536 ampl1-

fier, for maximum output with minimum distortion under varying speaker loads.
(d) The mute and play switch is the same as used on the 536 amplifier and is wired to mute both channels. Wiring diagram 116396-1 shows the connections for this switch.

## 2. POWER SUPPLY

The stand-by heater circuit for the amplifier tubes is the same as on the 536 amplifier. The transformer ( $\mathrm{Fig}, 96$, Item 4) is the phonograph junction power and will be energized during the normal at rest position of the phonograph. Its filament winding in phase and in series with the filament winding on the amplifier power transformer (Item
3) provides partial current to the filaments. When a selection is made the transformer (Item 3) will be energized by the closing of the over-ride relay contacts quickly bringing the tubes to playing temperature by the time the record is in playing position. The transformer (Item 3) also supplies, in conjunction with the three Silicon Diode Rectifiers (Fig. 97, Items 5 and 6), the high voltage for the amplifier tubes.

## TROUBLE SHOOTING

## TROUBLE SHOOTING

## TROUBLE SHOOTING

## TROUBLE SHOOTING CHART 2400 SERIES

## POWER AND LIGHT FAILURE

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :---: | :---: | :---: | :---: |
| 1. No power to phonograph. | Fluorescent lamps fail to light <br> Phonograph fails to operate. | (a) Line cord plug not making contact in outlet. | Repair or replace plug or outlet. |
|  |  | (b) Line cord broken. | Repair or replace cord. |
|  |  | (c) Fuse blown in amplifier. | Replace 15 amp . fuse in amplifier. |
|  |  | (d) "House" fuse blown. | Check for overload. Replace fuse. |
|  |  | (e) Main switch broken. | Replace main switch in amplifier. |
| 2. Fluorescent lamp fails to light. | Phonograph operates normally. <br> No fluorescent lights available for program and cabinet. | (a) Defective lamp. | Replace lamp. |
|  |  | (b) Defective starter. | Replace starter. |
|  |  | (c) Faulty ballast. | Replace ballast. |
|  |  | (d) Open circuit in lamp or ballast wiring. | Trace and repair. See Wiring Diagram Pages 63 and 64. |
|  |  | (e) Lamp loose in socket. | Seat lamp firmly in socket. |
| 3. Fluorescent lamps light. <br> Select lamp fails to light. | Phonograph operates normally. | (a) Lamp burned out. | Replace with No. 44 Mazda Lamp. |
|  |  | (b) 150 ohm resistor open on selector button panel. | Replace resistor. Refer to schematic applicable to model in question. |
|  |  | (c) Open circuit to select lamp. | Trace and repair. Refer to schematic applicable to model in question. |
|  | Phonograph fails to select or operate. | (a) Safety switch open. | Adjust safety switch. Normally held closed by record guide assembly. |
|  |  | (b) Warped record jammed between record carrier and record guide casting. | Remove Warped record. |
| 4. Select lamp lights <br> Phonograph falls to operate. | Phonograph selection circult operates. <br> Mechanism fails to operate. | (a) Record loading switch turned off or fails to operate. | Turn on record loading switch. Front of chassis mounting plate. |
|  |  | (b) Service switch turned off. | Turn service switch on. |
|  |  | (c) Defective service switch. | Replace switch. |
|  |  | (d) Transfer switch contacts fail to make in at rest position. | Clean and adjust contacts. See Page 26. |
|  |  | (e) Reverse relay N. C. contacts fail to make in at rest position. | Clean and adjust contacts. Located in junction box. |
|  |  | (f) Play switch contacts fail to make in at rest position. | Clean and adjust contacts. See Page 26. |
|  |  | (g) Over-ride switches fail to close. | Clean and adjust switches. See Page 14. |

## COIN AND CREDIT FAILURE

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :---: | :---: | :---: | :---: |
| 1. Rejects coins. | Coins are returned or hang up in rejector. | (a) Bind in scavenger rod holding reject gate open. | Remove bind in scavenger rod linkage. |
|  |  | (b) Incorrect adjustment in rejector. | Adjust rejectors in accordance to National Rejectors bulletin. |
|  |  | (c) Rejector needs cleaning. | Clean dirt and foreign matter from rejectors. |
| 2. Quarter and half dollar coins drop through to cash bag. No credits. | Quarters and half dollars fail to establish credits. <br> Nickels and dimes establish credits. | (a) $8 / 10 \mathrm{amp}$. fuse blown in playrak. $25 \phi$ and $50 \phi$ coins hang on coin switches. | Adjust coin switches. See Page <br> 4. Replace fuse. |
|  |  | (b) Open or burnt coin magnet coils. | Replace coin magnet coils in playrak. See Page 4, Fig. 6. |
|  |  | (c) Incorrect aligument of rejector and coln switch levers. | Seat rejector fully into mounting frame. Align coin switch levers as shown on Page 4, Fig. 5. |
|  |  | (d) Dirty or incorrectly adjusted key switch. | Clean and adjust key switch as shown on pages 4 \& 5, Figs. $7 \& 8$. |
|  |  | (e) Excessive spring pressure or poor contact on coin switches. | Clean and adjust coin switches. See Page 4, Fig. 5. |
| 3. All coins drop through to cash bag. No credits. <br> "Select" light fails to come on. | All coins fail to establish credits. | (a) Coin switch plug not seated in slug rejector socket. | Seat plug firmly in socket. |
|  |  | (b) Open ground connection of coin switch assembly. | Check common circuit feeding all coin switches. See schematic for model in question. |
|  |  | (c) Open circuit or faulty solder connection in coin mechanism. | Check wiring and connections. See diagram of model in question. |
|  |  | (d) 2 amp. fuse blown in D. C. circuit. 8 amp . fuse blown in 24 V A.C. circuit. | Check for short circuit. Check fuses for right size. |
| 4. Free credits on nickel or dime deposit only. | Continuous free credits on nickels or dimes <br> Quarters and half dollars establish correct credits. | (a) Nickel or dime coins hang on coin switch. | Adjust and check coin switch as shown on Page 4. |
|  |  | (b) Nickel or dime coins hang at bottom of rejector, holds coin switch closed. | Check coln exits of rejector with colns. Remove burrs or obstruction causing coins to hang. |
|  |  | (c) Nickel or dime coin switch incorrectly adjusted - contacts stay closed. | Adjust and check contact clearance and pressure as shown on Page 4. |
| 5. Occasional extra credits on quarter and half dollar coins. | More than normal number of credits for coin deposited. | (a) Cancel pawl occasionally fails to engage next ratchet tooth of cancel wheel. | Adjust cancel solenoid position and pawl adjusting carn for correct pawl stroke as shown on Pages 5 \& 6 |
|  |  | (b) Accumulator wheels bounce when cancel coll operates. | Same as above. See Pages 5 and 6. |
|  |  | (c) Key switch occasionally falls to open. | Adjust key switch. See Pages 4 \& S, Figs. 7 \& 8. |

COIN AND CREDIT FAILURE CONT'D.

## SELECTION CIRCUIT CONT'D.

| SERVICE CALL | SYMPTOMS | CAUSE | GORRECTIONS |
| :---: | :---: | :---: | :---: |
| 3. Select Iight on. Electric selector operates. <br> Phonograph fails to operate. | Selector pins fatl to release. | (a) $8 / 10 \mathrm{amp}$. fusetron blown in letter coil circuit. | Check for grounded letter coil. Replace fuse. |
|  |  | (b) Mechanical bind in latch solenoid plunger. | Adjust latch solenoid coil for free movement of solenotd piunger. Clean plunger. |
|  |  | (c) Dirty contacts 5 and 6 on latch relay in stepper or contacts 1 and 2 on TR-3 when stepper is used. | Clean and adjust contacts. See Wiring Diagram for locations of contacts and page 42. |
|  | Selector pins released. Changer motor, turntable motor and amplifier fall to turn on. | (a) Bind in wobble ring or override switches not making contact. | See Page 14. for adjustments. |
| 4. Plays extra records when a certain selection is made. | Two or more selector pins released when one selection is made. | (a) Selector coil selected shorted to adjacent coll or colls. | Remove short between coils in selector drum assembly. |
|  |  | (b) Short between selection circuits in selector button switches, selector button switch cables, or plug and sockets. | Check cable, plugs and sockets for short. Repair. |

MECHANICAL AND ELECTRICAL FAILURES

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :---: | :---: | :---: | :---: |
| 1. Selects, but fails to start mechanism. | Fails to release selector pins. | (a) Letter or number selector button backs out too far after a selection is made opening the selector circult to the number or letter colls. | Take up lost motion in the selector button switch connector link. Check selector switch latch adjustment for minimum overtravel. See Page 12, paragraph c. |
|  |  | (b) $8 / 10 \mathrm{amp}$. fuse blown in letter coil circuit. | Check for right size fuse. Replace fuse. |
|  |  | (c) Open letter coil. | Replace letter coil. |
|  | Selector pins release. Mechanlsm fails to start. | (a) Open over-ride switch. | Clean and adjust switch. Page 14. |
|  |  | (b) Open contact on reverse relay. | Clean and adjust switches. Located in junction box. |
|  |  | (c) Open contact on transfer switch. | Clean and adjust switches. Page 26. |
|  |  | (d) Open record loading switch. | Replace switch. Located at front of changer. |
|  |  | (e) Open service switch. | Replace switch. Located in junction box. |
|  |  | (f) Changer motor trouble. | Clean commutator or replace motor. |
| 2. Selects, searches, brings up record, Then blows 2 amp . fuse. | Changer motor is jammed in search posltion with record lift arm in carrier. | (a) Transfer switch failed to actuate in reverse cycle of Changer motor. | Adjust transfer switch actuator screw. Clean contacts. See Page 26. |

MECHANICAL AND ELECTRICAL FAILURES CONT'D.

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :---: | :---: | :---: | :---: |
| 3. Plays wrong selections. | Occasionally repeats same selection. | (a) Not cancelling selector pin. <br> (b) Improper adjustment of carriage switch or stop screw. | See instructions for proper adjustment. See Pages 17 and 18. |
|  |  | (c) Selector pin assembly not properly centered. | See Page 16. |
|  |  | (d) Short at commutator rings:. | Check for short, carriage switch must make and break. |
| 4. Repeats same selection continuously. | Main cam motor turns in a reverse position but does not drive record carrier. | (a) Driving pawl tension spring broken or weak. | Turn mechanism manually until hole in main drive gear is directly over driving pawl mounting screw. Remove nut and screw and work driving pawl out. <br> Replace with new driving pawl. |
| 5. Repeats same selection occasionally. | Selector crank jammed against cancelled selector pin. | (a) Wrong holding pawl engaged rooth on record carrier casting. | Check adjustment of actuating screw and stop screw. See Pages 22, 23, 24 and 25. |
|  |  | (b) Cancelled selector pin fails to latch. | Check selector pin cancelling adjustment. Pages 17 and 18. |
| 6. Some records fail to play. | Record fails to clamp on turntable. | (a) Record hole off center. | Remove bad record. |
|  |  | (b) Worn turntable clamp washer. | Replace worn clamp washer. |
|  |  | (c) Record guide track stop brackets not properly adjusted. | See instructions for adjustments, page 21. |
|  |  | (d) Record lift arm up position not properly adjusted. | See instructions for adjustments, page 20. |
| 7. Turntable turns, no music. | Tone arm misses record | (a) Undersize record. | Remove undersize record. |
|  |  | (b) Tone arm feed-in start position not properly adjusted. | Adjust tone arm start position. See Page 29, w (1). |
|  |  | (c) No record in carrier selected space. | Place record in empty space. See pages $21 \& 22$ for back stop pawl adjustment. |
| 8. Turntable fails to run. | Amplifier dead. | (a) Over-ride relay fails to energize. | Check Schematic for model in question. |
|  |  | (b) Dirty contact on over-ride relay. | Clean and check contacts for proper action. |
|  | Amplifier on. | (a) Loose drive pulley. | Tighten Allen set screw and pulley. |
|  |  | (b) Defective turntable motor. | Repalr or replace motor. |
|  |  | (c) Turntable belt broken ("O" ring). | Replace " 0 " Ring. |
| 9. Record falls to cancel. | Record falls to return to carrier after play * ing. | (a) Trip switch not operating. | Adjust trip switch. Page 30 (5). |
|  |  | (b) Defective trip switch. | Replace defective switch. |

MECHANICAL AND ELECTRICAL FAILURES CONT'D.

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :---: | :---: | :---: | :---: |
|  |  | (c) Open contact in play switch. | Clean and adjust contacts. |
|  |  | (d) Open in reject button. | Repair or replace reject button. |
|  |  | (e) Open contact on remote cancel relay if used. | Clean and adjust relay contacts. |
| 10. Mechanism runs slow. | Changer motor slow. | (a) Defective selenium rectifier, | Replace defective rectifier. |
|  |  | (b) Dirty commutator on changer motor. | Clean changer motor commutator |
| 11. Record comes up. Returns without playing. | Puts record back without playing. | (a) Open contact on play switch. | Clean and adjust contacts. |
|  |  | (b) Dynamic brake circuit not working. | Check schematic circuit at play switch, trip switch, reject button, transfer switch. |
|  |  | (c) Defective trip switch. | Replace trip switch. |
|  |  | (d) Reject button sticking. | Repair reject switch. |
| 12. Throws records. | Throws records. | (a) Bind in record lift arm guide rollers. | Adjust guide rollers. See pages 18 and 19. |
|  |  | (b) Guide tips on record lift arms not properly aligned. | Straighten guide tips. See Page 19. |
|  |  | (c) Bent record separators. | Straighten record separators. |
|  |  | (d) Carrier not properly indexed. | See Page 21 for back stop pawl adjustment. |
| 13. One slde of record okay. The other side distorted tone. | One side of record turns at 45 RPM . The other side does not. | (a) Record track stop brackets not adjusted properly, causing record to drag. | Adjust record stop bracket. See Page 21 . |
|  |  | (b) Record lift arm coming up too high. | Adjust record lift arm stop. See Page 20. |
| 14. Music skips. | Tone arm jumps one or two grooves, giving a thumping sound while record is playing. | (a) Worn needle. | Replace needle. |
|  |  | (b) Too much end play in turntable shaft. | Shim between turntable pulley and bushing. See Pages 32 and 33. |
|  |  | (c) Tone arm not balanced properly. | Check tone arm balance. See Page 30 (4). |
|  |  | (d) Tracking pressure of tone arm too light | Check tone arm gram pressure. See Page 30 (3). |
| 15. Excessive record wear. | Record wear faster than normal. | (a) Worn or chipped needle. | Replace needle. Replace worn record. |
|  |  | (b) Bind in tone arm. | Check for freedom of tone arm cable. Free bind in tone arm. |
|  |  | (c) Incorrect needle pressure. | Adjust tone arm for proper gram pressure. See Page 30 (3). |

## MECHANICAL AND ELECTRICAL FAILURES CONT'D.

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :--- | :--- | :--- | :--- |
|  |  | (d) Poor material in records. | Replace worn records. Check <br> needle wear. |
| 16. Excessive lint <br> accumulation on <br> needle. | Needle skips, sound <br> distorted. | (a) Excessive lint and dust from |  |
| records. |  |  |  |$\quad$| Remove lint from needle and |
| :--- |
| brush with small brush. Spray |
| needle, cartridge and brush with |
| Anti-Static Cleaner. |

## SOUND FAILURE

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :---: | :---: | :---: | :---: |
| 1. No sound. | Turntable turning. No sound from record. | (a) Pick up cartridge open or shorted. | Check contacts on cartridge. Replace if defective. |
|  |  | (b) Pick up cable not connected or open. | Check pick up cable for open. |
|  |  | (c) Blown 2 amp . amplifier fuse. | Replace fuse in amplifier with proper size. |
|  |  | (d) Defective tube, | Replace defective tube. |
|  |  | (e) Volume control turned off. | Turn up volume control. |
|  |  | (f) Remote volume control jumper plug out. | Replace jumper plug. |
| . |  | (g) Mute switch shorted. | Clean and adjust mute and play switch contacts. Page 26. |
|  |  | (h) Open speaker circuit. | Check and repair open speaker circuit. |
| 2. Sound blasts in at start of record. | Automatic level control not squelched. | (a) Mute and squelch switch not connected. | Insert mute and squelch plug. |
|  |  | (b) Open contact on squelch switch. | Adjust play switch to operate squelch circuit. Check contacts. |
|  |  | (c) Defective 12AU7 or 12AX7 tube. | Replace defective tubes. |
|  |  | (d) Selector pins released before phonograph is connected to line. | Selector pins should all be down before line cord is connected. |
| 3. Poor tone quality. | Tone distortion. | (a) Remote speakers mismatched. | Check remote speakers for proper phasing. |
|  |  | (b) Wrong remote volume control used. | Check model of remote volume control. |
|  |  | (c) Remote volume control not properly connected. | Check wiring of volume control. |
|  |  | (d) Worn or defective cartridge. | Replace defective cartridge. |
|  |  | (e) Defective tubes. | Replace bad tubes. |

## SOUND FAILURE CONT'D.

DUAL PRICE PHONOGRAPH

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :---: | :---: | :---: | :---: |
| 1. Fails to accumulate credits on $10 \phi-25 \phi-$ $50 \not \subset$ coins. | Accumulator motor fails to run. | (a) Dirty contacts at coin trip switches, | Clean and adjust. See page 9, paragraph f. |
|  |  | (b) Coins jammed in coin tracks. | Clean coin tracks. Check for bent coins. |
|  |  | (c) Lower coin stop hung open. | Check full cycle switch page 9 , paragraph g. Check for freedom of action. |
|  |  | (d) Dirty contact 5 and 6 on anticheat relay. | Clean and adjust contact. |
|  |  | (e) Open contact at rotary wiper arm and accumulator printed board. | Adjust contacts. See page 9, paragraph h . |
|  |  | (f) Anti-cheat relay fails to operate. | Clean and adjust coin trip switches, page 9, paragraph f. Clean and adjust rotary contact arms on accumulator printed board, page 9, paragraph h. |
|  | Motor runs, fails to accumulate credits. | (a) Dirty contacts 1 and 2 on anti-cheat relay. | Clean and adjust contacts. |
|  | Accumulator motor starts then stalls. | (a) Full cycle switch fails to close. | Clean and adjust contacts, page 9, paragraph g. |
| 2. Phonograph won't select. | Credits add and make select light is on. <br> Latch coil is energized, buttons won't latch. | (a) Dirty contacts 3 and 4 on anti-cheat relay. | Clean and adjust contacts. |
|  |  | (b) Dirty contacts 1 and 2 on TR-1. | Clean and adjust contacts. |
|  |  | (c) Poor contact at rotary wiper arm and interlock circuits printed board. | Adjust Contacts. See page 9, paragraph h. |
|  |  | (d) Trying to select a $15 \phi$ selection with only $10 \phi$ credit. | Insert another coin. |
|  |  | (e) Dircy contact 3 and 4 on pricing relay. | Clean and adjust contact. |
|  |  | (f) Open circuit at $10 \notin$ pricing bar. | Check for proper group connections on l0申 price bar. |
|  |  | (g) Open circuit at $15 ¢$ pricing bar. | Check for loose connections. |
|  | Buttons lock in - won't select. | (a) Dirty contact 1 and 2 at control switch of latch coil. | Clean and adjust contacts, page 12, paragraph e. |
|  |  | (b) Dirty contact, letter or number latch switch. | Clean and adjust latch switches, page 12 , paragraph f . |
|  |  | (c) Dirty contact 3 and 4 on number pulse relay in stepper. | Clean and adjust contact. |
|  |  | (d) Dirty contact 9 and 10 on latch relay in stepper. | Clean and adjust contact. |
|  |  | (e) Open contact at number selector switch. | Adjust latch lever, page 12 , paragraph $c$. |
|  |  | (f) Open number selector coil. | Replace defective coil. |

DUAL PRICE PHONOGRAPH CONT'D

| SERVICE CALL | SYMPTOMS | CAUSE | CORRECTIONS |
| :---: | :---: | :---: | :---: |
| . |  | (g) Blown 3/10 Amp. selector coil fuse. | Check for grounds in circuit and replace fuse. Check start switch operation and contacts 5 and 6 on TR-2. Check contacts 5 and 6 on TR-3 - clean and adjust. |
|  |  | (h) Burned out \#55 lamp in TR-2 <br> circuit - bottom of stepper. | Check for burned out number coils. Replace lamp. |
|  |  | (i) Dirty contact 7 and 8 on TR-2. | Clean and adjust contact. |
|  |  | (j) Dirty contact 5 and 6 on TR-2. | Clean and adjust contact. |
|  |  | (k) "Start" micro switch fails to operate. | Check switch action and adjustment, page 13 , paragraph b . |
|  |  | (o) Rocker plate jammed. Cannot rotate. | Check for bent letter coil plungers. Check rocker plate adjustments, page 13, paragraph a. |
|  |  | (p) Dirty contact 5 and 6 on TR-3. | Clean and adjust contact. |
|  | Takes off credits but does not relase selector pin. | (a) Blown $8 / 10$ selector coil fuse. | Check for grounded circuits. Replace fuse. |
|  |  | (b) Open at letter selector switch. | Latch levers not properly adjusted. See page 12, paragraph c. |
|  |  | (c) Open letter selector coil. | Replace defective coll. |
|  |  | (d) Dirty contact 1 and 2 on pulse relay. | Clean and adjust contact. |
| 3. Cheats customers | Does not give correct number of selections but accumulates correct number of credits. | (a) Fails to add extra credit on accumulator when making $10 \nless$ selections due to dirty contacts 1 and 2 on pricing relay. | Clean and adjust contacts. |
|  |  | (b) Dirty contact 9 and 10 on pulse relay. | Clean and adjust contact. |
|  |  | (c) Dirty contact 4 and 5 on transfer relay in stepper. | Clean and adjust contact. |
|  |  | (d) Dirty contact 7 and 8 on TR-3 in bottom of stepper. | Clean and adjust contact. |
|  |  | (e) Cancel pawl stop bracket not properly adjusted. | See pages 6 and 7, paragraphs b and d for adjustment. |
| 4. Plays free. | Fails to cancel credits. | (a) Dirty contact 7 and 8 on pulse relay. | Clean and adjust contact. |
|  |  | (b) Mechanical bind in cancel linkage or spring off cancel pawl. | Check for proper cancel action and missing or broken springs. See pages 6 and 7, paragraphs $b$ and d. |
|  | Adds too many credits | (a) Escapement pawl of accumulator not properly adjusted. | See page 6, paragraph a for proper adjustment. |
|  |  | (b) Coin trip switches not opening. | See page 9, paragraph f for switch adjustment. |
