 firsts make learning Electronics at home fast and fascinating give you priceless confidence.

## Some NRI fïrsts

[^0]
## in training equipment

filist
to give you a unique, exciting digital computer with memory built especially for home training. You learn organization, trouble shooting, operation, programming as you build and use it. Performs the same functions as commercial computers. Lessons stress computer repair. You conduct a hundred experiments, build hundreds of circuits. A solid-state VTVM is included among ten training kits.

## NRI's "discovery" method is the resúlt of over half a century of leadership simplifying and dramatizing training at home

The FIRSTS described below are typical of NRI's half century of leadership in Electronics home training. When you enroll as an NRI student, you can be sure of gaining the in-demand technical knowledge and the priceless confidence of "hands-on" experience sought by employers in Communications, Television-Radio Servicing and Industrial and Military Electronics. Everything about NRI training is designed for your education . . . from the much-copied, educator-acclaimed Achievement Kit sent the day you enroll, to "bite-size" well-illustrated, easy to read texts programmed with designed-for-learning training equipment.

## YOU GET YOUR FCC LICENSE OR YOUR MONEY BACK

There is no end of opportunity for the trained man in Electronics. You can earn $\$ 6$ or more an hour in spare time, have a business of your own or qualify quickly for career positions in business, industry, government. And if you enroll for any of five NRI courses in Communications, NRI prepares you for your FCC License exams. You must pass or NRI refunds your tuition in full. No school offers a more liberal money-back agreement. The full story about NRI leadership in Electronics training is in the new NRI Catalog. Mail postage-free card today. No salesman is going to call.
NATIONAL RADIO INSTITUTE, Washington, D.C. 20016
APPROVED UNDER NEW GI BILL if you have served since January 31 , 1955,

or are in service, check GI line on postage-free card.

## designed from chassis up for your education

firstto give you true-to-life experiences as a communications technician. Every fascinating step you take in NRI Communications training, including circuit analysis of your own 25 -watt, phone/cw transmitter, is engineered to help you prove theory and later apply it on the job. Studio equipment operation and troubleshooting become a matter of easily remembered logic.

firstto give you completely specialized training kits engineered for business, industrial and military Electronics. Shown above is your own training center in solid state motor control and analog computer servo-mechanisms. Telemetering circuits, solid-state multi-vibrators, and problem-solving digital computer circuits are also included in your course.

## APOLLO WITHOUT ELECTRONICS

#### Abstract

By the time this appears in print, any excitment that may have been generated by the successful flight of Apollo 16 to the moon and back will have been dissipated. Even while the flight was going on, all it meant to most people was reading a couple of newspaper headlines or watching briefly the TV coverage. But how blasé can we get? Maybe it's just the enormity of the achievement or because men have walked on the moon before. Or, maybe it's because there were more important things to be concerned about at the time. Whatever the reason, most people simply accepted the moon flight as a matter of course.

However those of us who are interested in electronics, either professionally or as hobbyists, should pause for a minute or two. Would it all have been possible without electronics?

There would have been no Saturn countdown computers monitoring more than 3000 parameters during the countdown leading to the takeoff. There would have been no inertial guidance system to keep Saturn on course. We would not have been able to track the flight from beginning to end using ground and shipboard radars.

We would not have been able to monitor the astronauts on the moon without the color-TV camera assembly which was controlled on the earth. There would have been no lunar communications relay unit to transmit voice, telemetry and color TV from the surface of the moon and receive transmissions from the earth. What about the lunar module communications system which transmitted and received voice, telemetry, biomedical data, commands, ranging signals and television to and from the earth on a microwave carrier a little above 2000 MHz , and to and from the command module orbiting overhead on a little under 300 MHz ?

There would have been no vhf ranging system to tell the distance between the lunar module and the command module. And no backpack radios for the astronauts to use while exploring the moon's surface. And no rendezvous radar/transponder, and no lunar module landing radar. And on and on the list goes.

We are not saying that the electronics was the most important thing on the flight, but we are saying that without it, the flight as we knew it would have been impossible. And that goes for the upcoming flight of Apollo 17 too.

# Sams guides you through the highways and byways of electronics 

MODERN DICTIONARY OF ELECTRONICS 4th Edition by Rudolf F. Graf
Completely updated definitions of approximately 18,500 terms used in the fields of communications. microelectronics, fiberoptics, semiconductors, reliability. computers, and medical electronics. Over 2000 terms have been added, and hundreds definitions have been updated. An invaluable reference.

All you need are \#4 mounting screws . . . just plug-in components ... like $1 / 4$ watt resistors, ceramic capacitors, diodes, I.C.s, transistors and more... and your circuit's built! No special patch cords needed! Components interconnected with any solid No. 22-26 gauge wire.

And you can try it with absolutely no risk for 5 days. If not satisfied, just return your EL Socket and receive a full refund. Trying is believing. How can you go wrong? Order your EL Socket now!

- Nickel/silver plated terminals - very low contact resistance
- Low insertion force
- Mounts with \#4 screws
- Initial contact characteristics beyond $\mathbf{1 0 , 0 0 0}$ insertions
- Vertical, horizontal interconnecting matrices
- Accommodates wide range of wire and component leads from .015"-.032"

Send check or M.O. today!

- Add $50 \not \subset$ for postage and handling
- $25 \%$ deposit on C.O.D.s

## CIRCLE NO. 15 ON READER SERVICE CARD

## ON THE INSIDE LOOKING OUT

Enclosed you will find a copy of a check for a subscription to Popular Electionics which appears to have been deposited in June of last year. Now, that's a long time to be without PE! The iudge so far (while making of me a bonafide "convict") has made me do without girls for ten years, but being withont Popular Electronics for five months constitutes "cruel and umusual pumishment." Please do something to relieve this situation before I have to take the matter up with a higher court.

Name Withheld
Higher courts notwithstanding, we have had to go to a lower authority to put things to rights. By the time you read this, you should be wallowing in $P E^{\prime}$ 's.

## GOING BEYOND THE BASICS

"What Makes The Transistor Tick?" (November 1971) has several misconceptions in the text which need clarification. The statement that ". . In their pure states, germanium and silicon crystals are electrically inert and behave in the manner of an insulator" is quite vague and, I believe, misleading. Intrinsic Ge and Si are classed as semiconductors-not insulators.

Later, discussing a pn function, the author states: "With no voltage applied to the diorle, no voltage clifference exists between the two types of material." This is incorrect. At ecquilibrium, a pn junction does have a voltage drop across it. Because of the migration of majority carriers across the junction, a potential harrier is formed, on the order of a few tenths of a volt. Attempts to observe this potential with a voltmeter fail becanse of the contact potentials formed between the meter and diode leads.
L. Arthur A. Read Physics Dept.
Waterloo Lutheran University Waterloo, Ontario, Canada

Both points made by Mr. Read are, in essence, lechnically correct. However, for purposes of the published article, aimed as it was toward the novice to solid-state electronics,
the discussion presented was more than adequate. No statement was made to the effect that Ge and Si are insulators-only that they behave that way when in their pure states. Regarding the potential bartier across the pl innction, discussion of the potemial difference is best left to techinician and engineering level texts.

## A SATISFIED CALCULATOR OWNER

In response to those critics (Letters, March 1972) of the November 1971 Electronic Desk Calculator, I would like to state that I am most satisfied with my kit purchase of the DIITS calculator. I assembled the kit without a hitch; the purts were all of excellent quality; and the ansembly instructions were perhapss the very best I have ever seen.

Carle. Dovle Duarte, Calif.

## DOCTOR LENDS HIS SUPPORT

In response to your poll on a home study course in medical electronics (Letters, March 1972), let me state that I am definitely interested in lending my support. If some school can devise such a course, and make it really worthwhile, I will be one of the first to subscribe.
I an a psychatrist who feels that medical electronics offers some great opportunities for breakthroughs in definitive treatment approaches. In putting together a home study corsurse in medical electronics, I feel that it should offer some information on building instruments such as a branwave detector. I know that this might appear to be a bit farfetched, but it would be folly to underestimate the ability and determination of the student.

> Pade A. Saxos, MD.
> Clinical Director Wyoming State Hospital Evanston, Wyom.

Most of the responses to our poll hate been enlhusiastic, to saly the least. Ent we have some bud news to report. At the time of this uriting no more than 30 responses have been receited; and of that 30, six were from medical electronics engineers and technicians and practicing physicians. This is hardly a figme with which io approach a home study school.

## A HELPFUL HINT

With all the cables and connectors used in the average hi-fi/stereo svstem, there is a very real need for keeping them identified. Ny solution in the past has been to use the small plastic "tiags" used to close plastic bread wrappers and the like. These tags can be marked with any waterproof marker then slipped over the cable lead.

Cabl S. Bluy<br>Ames, Iowa

From the PACE L. S. Engineering Feam that introdueed the first all transistor CB transceiver, the Model 223 offers another breakthrough in both Price and Quality. Taking advantage of U.S. mass production techniques and engineering knowhow, the PACF: Model 223 provides the truly great bargain for todays CBoperator who wants performance and price with the quality guarantee of a U.S. manufacturing firm. With a NO compromise desigh approach the PACE engineers built a double conversion recciver with a full 6 scetion tuned filter network for maximum receiver performance even under adverse conditions - we can guarantee performance for 2 years because we shake every one in the roughest QC test proceedure ever designed for 2 way radios.
If you comparebcfore youbuy you'll join the Proud Pace owner's club!

[^2]
## Get a little

More job.
If you qualify, we can guarantee you any one of 68 job fields. What's more, we'll send you to a school that will make you a real pro. That way, you get more jobs in the Navy and when you get out, you've got somewhere to go.

## More choice.

There's a new 3 year
Navy enlistment. So you can come in for 6 years or 4 years or now, 3 years.

More guarantees.
You can be guaranteed East or West Coast and choice of sea duty or airman recruit work.

## More travel.

See Africa. See Europe. See Japan. Join the Navy and see the world. (It's still true.)

More bread.
New guys now earn $\$ 288$ a month. (Congress gave us a raise.)

## More hair.

You can wear a beard (nicely trimmed) if you want to. It's a Naval tradition. It's also a brand new Navy.

## More freebies.

Besides free travel and free education and that $\$ 288$ a month, you get free food and free clothing and free housing and free health care and 30 paid vacation days per year.

If you think you've got what it takes to make it in the new Navy,

## Call: <br> 800-424-8880

It's toll free, there's no obligation, and a real live Navy recruiter will answer all your questions 24 hours a day, seven days a week. In Washington, D. C. call 433-2000.

## Or:

See your Navy man right now. He's listed in your phone book under U.S. Government, Navy. He's got all the answers-or he knows where to find them.

## Or:

# Ecstasy. At a price that won't cause too much agony. 

Before the ecstasy of listening to your new stereo equipment comes, alas the agony of shopping for it - the frustration of wanting this feature, and that spec. and finding that your budget won't quite cover it

Sony has something to ease the pain. The STR6036. An FM Stereo/AM-FM receiver for the man with a small room, a small budget but big ears nonetheless.

It's an inexpensive receiver that doesn't sacrifice performance, specifications, contral flexibility. sound quality, or even looks.

What it does sacrifice, of course, is just a bit of power. The STR-6036 delivers 50 clean watts of IHF dynamic power at 4 ohms*. That's quite enough to drive even most low-efficiency "bookshelf"speakers, even if it's not enough to rival the power company,
or to let you bust your buttons bragging about it.
The tuner, though, makes no concessions: It has a sensitive, overload-proof FET front end. And ceramic i.f. filters that increase selectivity and never need realignment. Plus a tuning meter for both AM and FM.
The controls have all the flexibility you'd expect from Sony: tape monitor, main/remote speaker selector, switchable loudness, even front-panel microphone input jacks.

And the control feel is typical Sony, too-firm, silky-smooth and positive. So the pleasure begins at your fingertips, even before your ears can start enjoying. Your pleasure will deepen to ecstasy when you hear the low price. As will your dealer's when you buy one. Sony Corporation of America, 47-47 Van Dam Street, Long Island City, N.Y. 11101.
${ }_{*}$ IHF standard constant supply method

## By I. Gordon Holt

IN MY LAST "Stereo Scene," we saw how your personality type-introvert or extrovert, sensitive or cloddish-might affect the kind of reproduced sound you like. This time, we'll consider how to choose a system that sounds that way.

If you've done any amount of component anditioning, in stores or in friends' homes, you will have noticed that loudspeakers differ more in sound from model to model than any other component in the audio chain. There are audible differences between pickups and tape decks, too; and even amplifiers and preamplifiers exhibit audible, although less conspicuous, differences. But since loudspeakers are the most highly colored and thus distinctive-sounding components, your choice of speakers will determine, to a major extent, how your audio svstem will sound.

We can divide loudspeakers into three basic sonic types, on the basis of the apparent distance that they seem to place between you and the sound. Some put the sound very close, giving the impression that the reproduced instruments are right in the room with you. Others have a noticeably distant perspective, giving the illusion of a good balcony seat in an auditorium, while others have a neutral perspective, making the instruments sound as far away from you as they were from the recording mikes. Most systems fall somewhere between the extremes of ultra-close and ultra-distant.

# Choosing the Sound You Want 

(You can vary the apparent distance of many speakers by adjusting the tweeter balance controls.) In terms of absolute fidelity, we can argue that the most neutral reproducers are the most accurate. But the absolutely accurate system may not produce the best illusion or reality for you, for a couple of reasons.

First, if you have a preference for a close listening seat at a live concert, close-up sound will be your criterion for reality, and the more distant sound of a neutral loudspeaker won't seem natural to you. Conversely, if you prefer and are accustomed to the kind of richness and breadth that you hear from a balcony seat at a live performance, close-up somed won't be realistic to you, either. You may find a few recordings whose miking makes them sound sufficiently distant or close to suit your taste, but most recordings aren't this extreme in either direction, so vou're better ofl letting the speakers provide the perspective vou prefer.

Second, there is the matter of the appropriateness of the reproduced sound's apparent distance. There are some kinds of musical performances that could conceivably take place right in your living room. A six-piece combo, a folk singer with guitar, or a string quartet could fit into a larger-than-average living room. So there is nothing unnatural about reproducing this kind of music with extreme closeness, giving the impression that the musicians are out in the room in front of the loudspeakers. A neutral loudspeaker camnot do this, for it maintains the origimal mike-to-instrument distances, and these distances can never be less than zero feet. Thus, the neutral system could place instruments that are miked extremely close right behind the loudspeakers, but could never bring them out into the listening room. Of course, you don't have to bring small performing groups right into the room with you, but the option

# Introducing the expensive dual-trace scope that doesn't cost a lot. 

The B\&K Precision Model 1470.
A solid-state 5 -inch scope that combines dual-irace triggered sweep with vectorscope capability.

Our DC to 10 MHz bandwidth with $10 \mathrm{mV} / \mathrm{cm}$ sensitivity makes the 1470 exceptionally versatile. And its TV-H and TV-V positions are a special plus.

Dual-trace lets you observe input and output wave forms simultaneously in the same circuit. And 16 -position triggered sweep, from $1 \mathrm{sec} / \mathrm{cm}$ to $0.2 \mathrm{sec} / \mathrm{cm}$ lets you sync them instantly.

On the other hand, you might prefer our Model 1465 single-trace, triggered-sweep scope at $\$ 359.95$. It has many of the same features and our patented CALI-BRAAN automatic voltage readout system.

Everything about our scopes is expensive - except their price.

For complete technical data, call your local B\&K distributor. Or write Dynascan Corporation.

Very good equipment at a very good price.

is there, and the effect would not stretch one's creclibility too much.

No Room for an Orchestra. But consider a full symphony orchestra, with maybe a 200 -voice chorus thrown in to add interest. By no stretch of the imagination could this assemblage be squeezed into your living room, and to attempt to create a right-in-the-room illusion here would be ludicrous. For large performing groups, the object is to try to transport the listener into the concert hall, rather than bringing the instruments into the living room. Consequently, the apparent perspective of the loudspeakers should be such that they give an illusion of listening from a distance, either from a close seat in the auditorium or (according to your preference) a more distant seat.

Whichever you choose, bear in mind that closeness in a loudspeaker goes hand-inhand with coloration, and extreme closeness means extreme coloration. This will impress itself on the instrumental sounds themselves and may change their quality enough to constitute a gross distortion of the original musical sounds. So, after you've found some speakers whose apparent closeness or distince seems to suit you, listen to them for naturalness of sound, using familiar program material.

The typical advice to the hi-fi shopperthat he listen and then buy what sounds "good" to him-is worthless to anyone who is looking for a semblance of fidelity in a system. "Good" is a value judgement, and what you feel to be good may be nothing more than what you are accustomed to hearing, or what your mind's ear thinks of as high fidelity. It takes a very well-trained ear to tell whether reproduced music sound like live inusic, because most of us who get to hear live music enjov it for its over-all effect, rather than listening analytically to its sonic details. This is not the case with natural sounds however.

Ever since birth, our brains have been storing recoguition clues about the sounds that are part of our lives until, by early adulthood, we are able to tell the approsimate size and weight of an object merely from the noise it makes landing on the flow in another room. We can even guess what the object was made of, or whether or not it broke. Our ears can tell us the size of a strean, the distance of a train, and (by the somods of tires on the street) whether it is hot, cool, or raining outside. Our ears can
also tell us, very easily, whether or not a natural sound sounds natural. For this reason, good somad-effects recordings can often give an instant and accurate impression of the fidelity of a reproducing system. Of course, you should still base your final decision on how the system sounds with music, but sound effects such as street traffic, fizzing soda pop, and hammering and sawing (for example) can usually be used to weed out the dross of the system and allow you to narrow the final choices to two or three likely contenders.

How Much Noise Do You Want? If your demands for audio quality are very high. there is much to be said for buying a highpower amplifier even if you don't plan to use your system for rattling windows. Eve॥ at low power levels, high-power amplifiers are usually better-that is, lower in distor-tion-than low-power ones, simply because they are generally designed to more stringent standards. If you plan to do a substantial amount of your listening at high to very high levels, a high-power anplifier is mandatory, as is a loudspeaker that will handle the kind of power you must feed it in order to produce the necessary listening levels.

If you're looking for live in-the-room listening levels, you should be wary of speakers with very low efficiency. These may burn out if cliven loudly for protracted periods of time. Speakers aren't usually rated in terms of efficiency, but if you do need efficient speakers you can spot them instantly in a listening comparison in your dealer's showroom. Without changing the volume-control level, switch to each of the speakers whose other qualities you feel you could live with, and choose the one that sounds the loudest over the entire audio range. (Some "elficient" speakers are that way only throughout their middle range. and mav have low efficiency at low frequencies.) Then choose an amplifier whose continuous power output rating is no greater than the signal or program power rating of the speaker. Huge brute force amplifiers may be safe to use for a while, but unless vou exercise constant caution, there is always the possibility of their demolishing your loudspeakers. (Of course, you can always fuse the loudspeaker.)

For extremely high listening levels, you should probably not even consider buying conventional hi-fi speakers. Special loud-
speaker systems are made for high-quality, high-level use, and if that's what you have in mind, you're best off buying a pair.

Are You a Diddler or a Listener? While we all pay lip service to the idea that highfidelity equipment is intended for listening to music, there are many audiophiles to whom the possession and manipulation of hi-fi equipment is the primary interest. So, before jumping in with both feet and buying an expensive system with hosts of knobs. Hashing colored lights and myriads of screwdriser adjustments to diddle, consides for a moment just what you want from your system.

Are you an inveterate knoh twiddler, who spends his evenings trving different londspeaker placements and checking the phasing of his twecters? It so, then by all means consider a complex system with all the controls you can pay for. If you have a good listening ear as well. and hear a lot of things in commercial recordings that you don't like von might even include in your system one of those multi-band equalizer devices that divide the andion range into 9 or 10) segments and allow you to combrol each one independently

Your diddling proclivities or lack of them, should influence vour choice of a primary music medium, too. Dises are simple to use, but the louder you play your system, the more audible the ir surface noise will he, and it takes care to keep disc surfaces in new condition. They must be handed with scrupulons care (no fingers on the grooves and no grit in the sleoves) and kept perfect Iy free from dust while playing.

It takes a persnickety persom incleed to observe the deaning ritnals that are necessary to keep a dise in mint condition, and if you are not so inclined, voure hetter off with one of the tape formats. nome of which have quite the polential for top fidelity that dises hate and all of which have somewhat higher liss than discs. Generally speating, open-reel tape offers the best fidelity of the tape formats, but many people like the tape-threading ritual even less than the disedeaning ritual; and. for them. cassettes are probably the best choice (unless the wish to plunge into 4 -chamel somm with RCA's Q-8 cartridges). Bear in mind, though, that at present, dises still offer by far the widest variety of available program material, so this factor alone may ontweigh the other disatluantages of the dise medium.

## You don't have to get a college

Next to a willingness to work, nothing will improve your chances of success in electronics more than a college-level education. But family obligations and the demands of your job may make it very difficult for you to attend classes. That doesn't mean you have to forget about getting ahead. CREI makes it possible for you to get the college-level education you need without going back to school.

## Learn at home

At your own pace, your own schedule . . . without giving up your present job. CREI lessons are written to be clearly understood without the presence of a teacher. Your problems are anticipated. Your instructors will work with you in a very personal manner and give you all the individual attention you need. Many men learn far more readily through home study than they ever did in the classroom.

## Not for beginners

CREI programs are written for men familiar with basic electronics, but who want to
get the advanced, specialized knowledge they must have to move up to engineering-level positions and engineering-level pay. AII CREI training material is developed with the help of top engineers and scientists from private industry and government laboratories. Each of these men is an expert in his field of electronics. He knows exactly what level of specialized knowledge a man needs to work successfully in that particular field today. This is your assurance that what you learn from your CREI study can be applied on the job.

You can have confidence in CREI
Since 1927, CREI has helped tens of thousands of men move ahead in every phase of the electronics industry. You'll find CREI graduates and students in key jobs wherever up-to-date knowledge of electronics is demanded. Leading companies recognize the quality of CREI education. Many pay all or part of CREI tuition for their employees.

## CREI education is

 up-to-date education CREI courses are continually being revised. New developments are included as quickly as they occur. Rightnow, CREI students are getting the latest information on cable TV, LSI chips, microminiaturization, lasers and masers, telemetry systems, servomechanisms and data links. If it's new in electronics, CREI-and youwill know about it.

## Twelve years - Five major advances

The twelve years of university research ${ }^{\dagger}$ that led to the design of the BOSE 901 and BOSE 501 DIRECT/REFLECTING® speaker systems revealed five design factors which optimize speaker performance:-
1 The use of a multiplicity of acoustically coupled full-range speakers - to provide a clarity and definition of musical instrument sounds that can not, to our knowledge, be obtained with the conventional technology of woofers, tweeters and crossovers.
2 The use of active equalization in combination with the multiplicity of full-range speakers - to provide an accuracy of musical timbre that can not, to our knowledge, be achieved with speakers alone.
3 The use of an optimum combination of direct and reflected sound - to provide the spatial fullness characteristic of live music.

4 The use of flat power response instead of the conventional flat frequency response - to produce the full balance of high frequencies without the shrillness usually associated with $\mathrm{Hi}-\mathrm{Fi}$.
5 Acoustical coupling to the room-designed quantitatively to take advantage of adjacent wall and floor surfaces to balance the spectrum of radiated sounds

To appreciate the benefits of these five design factors, simply place the BOSE 901 directly on top of the largest and most expensive speakers your dealer carries and listen to the comparison.

## You can hear the difference now.

## News Highlights

## More Quartz Crystal Wrisiwatches

Fver since the announcement by Bulova some months ago of a $\$ 395$ quartz crystal wristwatch, other companies have been rushing to announce their versions. One of these is the Waltham Watch Co., which has amounced the marketing of a quartz crystal controlled watch al under $\$ 200$. Unlike the Bulova version with its conventional moving hands, the Waatham version uses a liquid erystal digital display to show the time. The liquid crystal segments forming the numerals become reflective when a low voltage is applied to them. Since there is little or no current flow, this type of display is very economical of battery power. The colon between the hours and minutes numerals blinks once a second to show the passage of time. Accuracy of the wateh is within five seconds a month.

Also amounced recently was a line of electronic watches bv Ebauches S.A., Switzerland. with cooperation from the company's partner, the Longines Watch Co. Ebauches S.A. has quartz crystal controlled watches with moving hands display or with liquid crystal digital display. These watches not only show the hours and ininutes but also the seconds and the date as well. The company does not sell watcles directly to the consumer but sells movements to watch manufacturers. Retail prices are expected to be below $\$ 300$. Watches from both companies use IC's as frequency dividers for the crustal oscillators. Replaceable batteries operate the watches for at least a year.

## TV Receiver with Memory Vision

A double-screen television receiver that permits instant, pushbutton freezing of action without interupting nomal viewing has been antnounced by Hitachi. The basic chassis is a standard black and white TV receiver with a 13 -in. picture screen. To the left of this is a second smaller (9 in.) picture tube. Both CRT's are housed in a single cabinet. When a pushbutton is pressed, the image on the main screen al that moment is transferred to the second screen, frozen and locked in indefinitely until the pushbutton is pressed again. Nommal viewing of the main picture tube goes on without interruption. Heart of the stopmotion system is a 4 -in. rotating magnetic disc on which the video signal is constantly being recorded.

## Russian Bank Orders U.S. Computers

The national bank of the U.S.S.R., Gosbank, has ordered two largescale Honevwell computer systems. valued at appoximately $\$ 5 \mathrm{mil}-$ lion. The computers will be installed at Gosbank's computation center in Leningrad and will service the three main branches of the stateoperated bank-the bank of foreign trade, the sanings branch, and the industrial, agricultural and administrative branch. The order includes 100 terminals, which will be linked by telephone lines to the computer center from lranch offices within a 180 -mile radius.

## Electronic Manufacturers Support Metric System

U.S. electronic manufacturers continue to be in favor of efforts currently underwav to convert this country to the metric system of
measurement. According to a membership survey completed by the Electronic Industries Association, manufacturers werwhelmingly approve of House joint Resolution 1092 which states that the policy of the U.S. will be to facilitate and encourage the substitution of metric measurement units for customary measurement units in all sectors of the economy with a view toward making metric units predominant. Most responders favor a plan that calls for government legislation with targetted changeover dates and vohintary induistry participation in the changeover.

## First Ham to Slow Scan Color Globally

William DeWitt (W2DD) recorly transmitted a color photo by neans of slow scan television (SSTV) to another ham in South Africa, who then recorded the signal and tramsmitted it back to DeVitt's Fairport, N.Y. station. For color SSTV, the picture to be transmitted is scanned by a camera through red, green and blue filters. The resulting monochrone information is translated into audio tones which modulate an SSB FM transmitter. To playback the picture, the receiving station photographs the sequential images through color decoding filters. For color image reproduction, a triple exposure of the three filtered images is made onto appropriate Kodak color films. Then processing is required to reconstitute the color photograph.

## GE Files with FCC for Four-Channel Broadcasting System

The General Electric Audio Electronics Products Dept. has filed a technical report with the FCC covering field testing of its four-channel discrete FM brondcasting system. The tests were conducted at the company's FM station, WGFM, at Schenectady, N.Y., during nonbroadcast hours. The transmission is compatible with existing monophonic and stereophonic receivers and music systems. The system transmits four discrete full-frequency 30 -to- 15,000 -hertz audio channels by adding an ultrasonic subcarrier above the present stereo subcarrier used for stereo FM broadcasting.

## Equipment Announced for Discrete Four-Channel Disc

The discrete four-channel disc developed by Victor Co. of Japan has thee proponents so far. They are subsidiary JVC America, as well as Panasonic, and RCA Records. RCA has alreadv amounced the release of a four-chamel disc, with more to come. Now the other two manufacturers are amouncing their equipment to play the dise. JVC is offering a demodulator at $\$ 100$, a special cartridge at $\$ 70$, and a combination record changer with built-in demodulator and cartridge at $\$ 190$. Panasonic is making available a demodulator at $\$ 135$ and a combination record changer with demodulator at $\$ 200$.

## Satellite Helps Save Two Patients

An earth-orbiting ATS (Applications Technology Satellite) recently helped save the life of one woman in Alaska and relieve another seriously ill patient on the same day. The satellite is functioning as a switchboard-in-the-sky in a statevide Alaskan communications experiment under a cooperative program between NASA, the State of Alaska, and the Lister-Hill National Center for Biomedical Communications (HEW). Some 26 terminals located in remote villages and hospitals equipped with thf transmitters and receivers use the satellite for communication to central locations in Alaska. During a routine educational program, the two emergency medical problems were reported. The satellite was kept in operation continuously while a doctor at the District Medical Center in Tanana, Alaska, provided instructions to the local nurse and an aide on the emergency treatment of the two patients.

# A summary of the important specs to look for when you are selecting a CB rig 

## Directory of Mobile

ANY motorist who travels the expressway system of this country can make good use of a class D Citizens Band (CB) radio transceiver. Easy to acquire and operate, CB is a fast and convenient means of summoning aid for yourself or any other motorist in an emergency. Chammel 9 is being used for this purpose. Many groups such as REACT (Radio Emergency Associated Communications Teams) monitor this channel to provide emergency communications. Other uses are momerous-from home you can keep in touch with the family car; from the store, you can contact the delivery van.
A class D Citizens Band license is for citizens who are over 18 vears old. The other requirements are covered by the filing of as simple form with the FCC and paying the fee of $\$ 20.00$. No written test is required. The application form is usually included with the transceiver and may also be obtained from any local FCC office.
The accompanying chart covers many models of mobile A.M CB transceivers. Units that are designed for base use with 12 -volt supply capalility are not included. Thev tend to be too large for most mobile appli-
cations. Units that cover less than the full 23 chamels are not included.
All figures given in the chart were supplied by the manufacturers. Where a manufacturer did not answer our questionnaire or followup plone calls, his products were not included.
Since space in the chart is at a premium, code letters often provide the desired data. Typical codes are "C" for calibrated, " N " for not available. " $S$ " for switched, " $V$ " for variable or adjustable, and " Y " for available. A question mark means the data were not supplied.

1. Manufacturer and Model. Among the models listed, the price and the number and quality of features offered in each model can help) in your selection of a satisfactory unit.
2. Price. The price is given in even dollars and in all cases is the manufacturer's wet. It includes the cost of a full set of crystals where they must be ordered separately. With crystal synthesis it is possible to provide 23 channels of transmit and receive with only 11 crystals. This makes

# CB Transceivers 

the set more economical than the sets which use a separate crystal for each transmit and receive chamel. The 36 extra crystals would cost about $\$ 75$ more.
3. Dimensions. As an aid in determining where this equipment will fit into your car, the height, width and depth are given in inches. A box built to these dimensions ivill help you to check for mounting in your glove compartment. next to your stereo, or other handy location.

Other necessary installation data includes the location of the mike connector and whether the speaker grill opens right or left, up or down. Code letters "L", "R", "U", "D", "M", and "S" represent left, right, up, down, mike and speaker.
4. Meter. A meter is arailable on many units to indicate the received signal strength " $S$ " and the relative $r$ - $f$ power output " $R$ " of the transceiver. The received signal may be calibrated. In this case, we give the number of microvolts input required to read S9. There is no standard reguirement so the value can be whatever the designer chooses. The application to mobile units is to aid in selecting a site for transmitting since the signal strength can vary enough over a feev feet to help in a marginal condition.

For the transmitter power the " $R$ " indicator serves to monitor the output. The meter reading will be affected by load variations that may occur if the antenna is damaged. The power output on most models is also affectes by the batterv voltage. Where the scale is not calibrated the " I " is used. For example, " 55 RI " means the S meter is calibrated for $S 9$ at 5.5 microvolts and the meter indicates relative r-f output.
5. Power Supply. The current drawn while transmitting and the receiver standby current are given. The " $\pm$ " before the first
reading tells that the unit can be operated on positive ground systems. All can be used on common negative ground. If your car has a positive ground, this may be an important feature.
6. R-F Power (Min. Watts). This is a measure of how well you are transmitting. The FCC rules limit the maximum power output of the transmitter to 4 watts. If the power input to the final amplifier is measured, the linit is 5 watts. The difference between a 3 -watt and a 4 -watt output results in a negligible difference in signal. The effective range would be increased only by about $10 \%$ for this power increase. More important is the protection of the output transistors from overload. If the unit is so protected a "P" comes after the power reading.
7. Automatic Modulation Control (AMC). One method of legally improving the effective output is to keep the percentage of modulation as high as possible. However, overmodulation (more than $100 \%$ ) produces distortion and interference with other stations, which, incidentallv, is illegal. For this reason an automatic modulation control is an important feature of a transceiver.

Some units have a light on the panel to indicate moclulation. An " $l$ " is indicative of this feature.
8. Output Filters. The rules of the FCC require that the harmonics and other frequencies outsicle of the $C B$ channel be limited to 50 dB below the on-frequency output. The figure thus presented should equal or exceed -50 dB .
The output filters used to accomplish the required attenuation may also be used to match the antenna impedance to the output transistors. The "P" stands for the pi type of low-pass filter while "T" stands for trap type used to filter one frequency.

Sometimes more than one section is used; for example, 2PT stands for two pi sections and one trap.
9. Sensitivity. No single figure will describe just how weak a signal the receiver will pick up. Noise and interference from other signals have a lot to do with reception of a weak signal. However, a figure can be given in microvolts required to make the signal plus noise 10 dB stronger than the noise alone. Thus, a low figure indicates a more sensitive receiver.
10. Spurious Responses. The reception of signals not on the desired channel can present problems that limit the use of the CB set. Signal image and i-f are the worst offenders. Other spurious signals may be a problem if the offending transmitter is close. The greater the minns dB figure on these values the better. The blocking of the front end of the receiver from very strong signals is very bad when an r-f noise blanker is used. If it is turned off, the reception may improve. Blocking also appears as distortion of very strong signals. The higher the blocking voltage, the better:
11. Selectivity. The audio frequencies transmitted are less than 3 kHz . Actuatly 2 kHz is adeguate. For this reason the -6 dB points should be at least $\pm 2 \mathrm{kHz}$. If one considers that the stations can be legally off frequency by as much as $0.005 \%$ ( 1.35 kHz ), it is obvious that a bit more bandwidth is neerled for the worst case. If delta
tuning is available, this can be used to compensate for the frequency tolerance.

The second figure is the amount of attenuation for a frequency 10 kHz from the center. This is indicative of how well a station on the next chamel can be eliminated. Ceramic or mechanical filters are usually used for this purpose.
12. Delta Tune. This is sometimes called a clarifier as it is used to make the signal clearer. Since the previous paragraph indicates that the transmitter can be as much as 1.35 kHz off the center frequency, this frequency shifter can be quite useful. It also can be used to enhance the amoment of adjacent channel rejection. "V" is for the variable control, " S " is for step or switched control. The number is the frequency change from the center.
13. Noise Limiters. The best method of eliminating noise is to suppress it at its source. When the transceiver is installed, ignition suppressors and generator filters are installed to reduce the impulse type of noise generated in your car. This still leaves the other vehicles around to cause interference. For this reason every mobile CB set has some type of built-in impulse noise limiter. The most common is the series diode gate "C", although some sets also have circuits that blank out the set momentarily during noise peaks. These r-f blankers " $B$ " are very helpful. They most he switched out "S" if a strong local station is present or they will blank each time the station comes on.

## LASER MACHINING PRODUCES ELECTRONIC CIRCUITS

A new laser "machining" process devised by Bell Laboratories engineers is capable of forming tiny electronic circuit patterns directly onto ceramic substrates. The new process, still in the experimental stages, makes use of a laser assisted by information stored in a computer that is programmed to describe the type of circuit pattern to be machined. In the process, substrates coated with a thin film of metal are mounted on a circular drum; and as the drum rotates, each substrate is successively exposed to a focused laser beam that is modulated, or switched on or off. Thus microscopic areas of the metal are either vaporized or left intact. A mirror steps the beam from line to line

POPULAR ELECTRONICS Including Electronics World

# Notr <br> IHE DOLBY TECHIQUE FOR REDUCING NOISE 

by Mannie Horowitz<br>Eico Electronic Instrument Co., Inc.

## SEVERAL COMPANIES ARE SOLVING THE TAPE NOISE PROBLEM WITH SPECIAL CIRCUITS IN THEIR RECORDERS. HERE'S HOW ONE OF THE MOST SUCCESSFUL SYSTEM WORKS.

NOISE can be defined as any undesired sired sigmission which accompanies a deining amount of noise be minute when compared with the signal, it is unobtrusive and considered negligible. However, even when it is not at all comparable in magnitude to the intelligence to be reproduced, it will interfere with the program material. Hence, noise mus! be reduced to the smallest possible levels.

Noise may be due to varions factors. Radio and tape recordings occasionally suffer from noise generated by radiation or induction from electrical equipment. Hose importment than this, the coating o: the tape used for recording consists of tiny closely packed particles. Although they are almost identical in size and magnetic characteristics, there are variations in the number of particles at different places on the tape. These variations are of all frequencies, but are most obviously reproduced as high-frequency nose or "tape hiss."

Theoretically uniform noise is known as "white noise." Interference of this type appears as a hiss and identical power is delivered at all frequencies. Tune your FM receiver between channels and the sound you hear, if your receiver does not have a
quieting circuit and you can disable the deemphasis circuit, is similar to white noise.

In addition to noise due to tape, the semiconcluctors in a tape recorder are the source of two topes of noise. One, partition noise, is caused by the irregular division of the total transistor emitter coment between the elements (base and collector) in the device. The second important source of noise in the transister is shot noise. This is due to the discrete particle nature of electricity and the statistical variations in the motion of these electrical particles as they pass through the semiconductor device.

Coise interference is a wide-band phenomenon. The car responds to noise at all andible frequencies but the most annoving is high-frequency hiss, above about 5000 $\mathrm{H} \not \approx$. Elimination or reduction of noise present in the top octave of the andio range is a desirable goal and various circuits have been designed to accomplish this.

Schemes To Minimize Noise. Before any method is applied to reduce noise, the amplifier must be designed so that it will be as noise-free as possible. Once circuit noise is minimized, the next step is to reduce noise originating from tapes or from any

Fig. 1. Input to Dolby network for a tape recorder goes through two paths, one being the special filter network.
other medium used to reproduce program material.

One of the most widely used methods to minimize the reproduction of high-frequency noise emplovs a low-pass passive filter. Low frequencies are passed freely to the output of the amplifier while the upper portion of the audio band is attenuated. A common arrangement consists of one resistor and one capacitor in a circuit designed to reduce high frequencies, letting them roll off at the eventual rate of 6 dB per octave. That is to say, every time the frequency doubles, the gain of the circuit is reduced by an additional 6 dB . If, for example, you wish to reduce noise b 10 dB at 5000 Hz , noise will be reduced by about another 6 dB at $10,000 \mathrm{~Hz}$ when the filter is used.

However, not only is the interfering noise reduced at these frennencies the desirable music or program content is reduced as well and high-fidelity qualities are lost. In fact, some attenuation begins to become quite evident at the frequency where the gain is reduced by 3 dB , or at 1600 Hz in this case.

The situation is improved by using two resistor-capacitor networks so that the eventual rolloff is at the rate of 12 dB per octave (twice the 6 -dB-per-octave rolloff rate of one network). If the gain at 5000 Hz is reduced by 10 dB with such a circuit, the frequency at which the attenuation becomes evident (circuit gain reduced by $3(\mathrm{BB})$ is now about 2100 Hz . This is an improvement over the previous case, but the output from the amplifier is still badly limited in bandwidth.

One method used to improve the signal-to-noise ratio when recording on tape is to "ride the gain." A maximum limit on the size of the signal that can be fed to the record preamplifier is set by the distortion or saturation characteristics of the tape. Weak signals which might be lost within the tape noise can be increased mantally
lefore being fed to the record amplifier. These signals can be boosted sufficiently before being recorded so that they can later override the noise during playback. Average and high-level signals can be manually limited in amplitude when fed to the recorder so that they will not saturate the tape. These signals are usually sufficient to mask any tape or record playback amplifier noise similar to them in frequency.

A variation of this procedure uses an electronic compressor to limit the output as the gain increases. The relative outputlevel difference between the loud and soft passages of music is reduced. Extremely loud passages of music are subdued so as not to overload the tape or tape amplifiers, while relatively low intensities of sound are recorded at comparatively higher levels. The opposite of the compressor-the ex-pander-is placed at the output of the tape recorder to restore normal amplitude relationships.

One big drawback to this system is the time it takes for the compressor and expancler to go into action. Another defect is "breathing" or noise modulation. Background noise is altemately increased and decreased, prochucing very amoying listening conditions.

Another very successful means of improving the signal-to-noise ratio uses preemphasis and de-emphasis in the recording and playback processes, respectively. Standard curves specify that the high frequencies be emphasized a fixed amount while recording on tape. These same frequencies are reduced by an equal amount during the playback process so that the overall frequency response is level. Noise is overridden by the large high-frequency signals placed on the tape in the record process and is reduced during playback due to attenuation of the high end of the band. This system is used on all tapes and playback equipment that is currently available on the market.

The Dolby System. Perfecting the procedure just described, and adding some additional brilliant features, Dr. Ray Dolby evolved an excellent method of reducing noise and hiss, along with any other type of undesirable low-level material found on tapes.

First, let us state the one thing this method of noise reduction cannot do. It cannot eliminate noise already recorded on the tape.

Similar to the compressor/expander and pre-emphasis/de-emphasis methods, the program material must be processed before it enters the recorder electronies and after it emerges. Here is how the Doflyy B-type system used in home recording equipment works.

However annoying, noise on tape is usually at a much lower level than the music or other program material. On loud passages, noise is masked by the program material. You do not hear the noise which may be 40 or 50 dB below the level of the desired sound.

During quiet passages, however, the level of noise is comparable to the level of the music. It is quite objectionahle. The Dolby noise-reduction system discriminates between loud and soft passages and attenuates noise only when it can be amoying, as is the case when low levels of material are being reproduced.

Tape hiss, heing a high-frequency phenomenon, is poorly masked by the low frequencies in the program material, even when the amplitude of the signal is high. Therefore, the Dolby system separates the high-frequency band from the low frequencies. Large signals at low frequencies will not keep the high-frequency moise from being attenuated. Only high-frequency am-

Fig. 2. These are record process characteristics. Playback is the inverse.

Fig. 3. Dolby output network from recorder has one path through feedback.
plitudes determine when noise will or will not be reduced.

Should fixed-filter circuits be used to determine or separate the high-frequency band from the low frequencies, breathing can become evident. Instead of a fixed filter, a variable type is used. The frequency characteristic automatically adjusts itself, by use of a feedback circuit, for the best performance.

Briefly, the input to the tape recorder takes the form shown in Fig. 1. The input signal follows two paths in the Dolby circuit betore being fed to a summing or adder network. One path is directly to the adder. The second path is through a network which separates the high-frequency but low-level input signals from the rest of the material to be recorded. The output of the network is significant above 1 kHz , rising to its maximum level at 5 kHz and above. The selected signals are amplified and fed to the adder. The sum of the direct signal and the amplified low-level, high-frequency signals, is then fed to the input of the tape recoder.

Let us say that the high-frequency filter, for those frequencies above 5000 Hz , and the level-selective network are actuated when any signal over 5000 Hz falls to $1 \%$ or less of the maximum input signal. This low-amplitude signal will then actuate the level-selective network and all frequencies of 5000 Hz and above are then amplified 2.16 times. The low-implitude portion of the signal, instead of being $1 \%$ or less of the maximum input signal, is now $1 \%+$ 2.16\% or $3.16 \%$ which is equivalent to increasing the low-amplitude signals by 10 dB. A compressor-type action is accomplished here as the low and high levels of the signal feeding the tape recorder approach each other in amplitude. Even though a wide gap exists between maximum and minimum amplitudes, the difference is narrowed by a factor of 3.16 or 10 dB . (See Fig. 2)

It should now be obvious that any signal $1 \%$ or less over 5000 Hz will be increased 10 dB while those signals over $1 \%$ will be allowed to pass through without any Dolby action. The direct opposite will be true on playback. Any signal that is of 10 dB level or below will again actuate the level-selective network and, in this case, attenuate all high frequencies to their previous nomal level.
The simple clescription above implies that the circuit has a sharp threshold at the $1 \%$ level. In practice. as the high-frequency signals rise above the $1 \%$ level, so the anount of boost introduced falls progressively from the 2.16 times. At levels of -20 dib and above, the boost is negligille, avoiding anv over-modulation prodnced by higher peak signal levels than nommally used.

The output from the preamplifier stages of the tape recorder feeds a network with frequency characteristics similar to the one at the imput (Fig. 3). However, this time the path is through a subtractor. All the
factors added to the signal by the network in Fig. I are now reduced by an equal amount. The original program material is restored in proper amplitude proportion, expanding the difference between the highand low-implitude portions of the signal. However, noise introduced by the tape and electronic's is reduced by about 10 dis over what it would have been without the intervening Doiby circuits. The amplified high-frequency signals introduced at the input of the recorder are capable of overriding much of the noise nommally generated while recording. Reducing gain of these frequencies at the output also diminishes the andible noise.

Althongh the svstem is complex, it can be made as a relatively simple and inexpensive circuit. The $10-\mathrm{dB}$ reduction in hiss and noise makes it quite worthwhile. When playing back a Dolbyized tape throngh conventional equipment, it is only necessary to reduce the treble response somewhat, nsing the tone control.

## BATTERY-POWERED LOCATOR BEACON FOR AIRCRAFT

ANEW crash locator beacon for aircraft is being used to help speed search and rescue operations in aiplane accidents. Called the "Pointer." the battery-powered device is a self-contained crash-proof unit which antomatically sends out signals from downed aircraft, regardless of the pilot's condition. Designed for survivable and nonsurvivable accidents, the Pointer can also be manually operated.

The line-of-sight transmission range of the

Pointer is up to 125 miles at an altitude of 10,000 feet; at 25.000 feet, the range increases to 200 iniles. The operating frequencies of the unit are 121.5 and 243.0 MHz . Reliable operation is obtainable over a $-40^{\circ} \mathrm{F}$ to $+150^{\circ} \mathrm{F}$ temperature range

The Pointer is made by Aero Electronics of Phoenix, Arizona. It employs as a power source a Mallary "Duracell" 8.10 -volt mercury battery which has a storage life rating of tivo vears.

## Solid-State Radiographic Screens

IT only takes a moment to have an X-ray taken. However, it takes quite a bit longer to have the film developed and ready for observation. If multiple $X$-ray photos are required, the time can really stretch out. Recently, the Westinghouse Electric Corp.. Electronic Tube Division, came up with two new solid-state radiographic screens that can convert X-rav images to visible images without significant time delay, but with energy gain and either storage or non-storage features

Essentially, this means that X-rivs cam now be used for inspection or non-destructive testing at almost any time. Not only is the radiation exposure time greatly reduced, relieving one major medical problem, but the resulting picture will have a much higher "readability." Resolution is about 6 to 8 lines per mon, while the contrast sensitivity casily meets the specs for nom-destructive testing.

One screen, used for storage, displavs its visible image for several hours. or until it is electrically erased. If a permanent record is required, the screen can be conventionally photographed.

The non-storage screen is a direct replacement for existing fluoroscopic erreens and provides up to 10 times the brightness. three times the contrast, and about three time better resolution than the comventional screen. Having a fast response, the noustorage screen is effective for both static and dyamic X-ray images. Its main application will be in production-line inspections and non-destructive testing. The nomstorage screen can also be photographed if a permanent record is required. The speed of either screen is equivalent to that of high-contrast, high-resolution photographic film.

The photoconductor-electroluminsecent (PC-EL) screens have a photoconductive portion which is sensitive to X-rays. The EL layer provides the visible image and is deposited on top of the PC laver to form a sandwich. A voltage is applied aeross the sandivich and, when the PC, laver is ex-
posed to X-rays, its electrical resistance decreases. This causes more of the applied voltage to be dropped across the EL, laver, thas causing it to cmit more light. The resulting light pattem exactly coresponds to the pattern of the incident X-ans.

The new amplifier screens are thin, lightweight, and shock resistant; and their development was supported, in part, bv NASA.

Dr. Zoltan Szepesi, of the Electronic Tube Division of Westinghouse Electric Corporation, shows how the contents of a woman's purse appear on a new type of radiographic amplifier storage screen for viewing X-rays.

## CIE graduate builds two-way radio service business into ${ }^{\text {¹,000,000 }}$ electronics company!

> How about YOU? Growth of two-way transmitters creates demand for new servicemen, field and system troubleshooters. Licensed experts can make big money. Be your own boss, build your own company. And you don't need a college education.

Two-way radio is booming. There are already nearly seven million two-way transmitters for police cars, fire department vehicles, taxis, trucks, boats, planes, etc., and Citizens Band uses. And the number keeps growing by the thousands every month. Who is going to service them? You can - if you've got the know-how!

## Why You'll Earn Top Pay

One reason is that the United States Government doesn't permit anyone to service two-way radio systems unless he's licensed by the FCC (Federal Communications Commission).

Another reason is that when two-way radio men are needed, they're really needed! A two-way radio user must keep those transmitters operating at all times. And, they must have their frequency modulation and plate power input checked at regular intervals by licensed personnel to meet FCC requirements.

As a licensed man, working by the hour, you would usually charge at least $\$ 5.00$ per hour, $\$ 7.50$ on evenings and Sundays, plus travel expenses.

Or you could set up a regular monthly retainer fee with each customer. Your fixed charge might be $\$ 20$ a month for the base station and $\$ 7.50$ for each mobile station. Studies show that one man can easily maintain at least 135 stations-averaging 15 base stations with 120 mobiles! This would add up to at least $\$ 12,000$ a year.

Edward J. Dulaney, Scottsbluff, Nebraska, (above and at right) earned his CIE Diploma in 1961, got his FCC License and moved from TV repairman to lab technician to radio station Chief Engineer. He then founded his own two-way radio business. Now, Mr. Dulaney is also President of D \& A Manufacturing, Inc., a $\$ 1,000,000$ company building and distributing two-way radio equipment of his own design. Several of his 25 employees are taking CIE courses. He says: "While studying with CIE, I learned the electronics theories that made my present
business possible."

## Be Your Own Boss

There are other advantages, too. You can become your own boss - work entirely by yourself or gradually build your own fully staffed service company. Of course, we can't promise that you will be as successful as Ed Dulaney, or guarantee that you'll establish a successful two-way radio business of your own, but the opportunities for success are available to qualified, licensed men in this expanding field.

## How To Get Started

How do you break in? This is probably the best way:

1. Without quitting your present job, learn enough about electronics fundamentals to pass the Government FCC exam and get your Commercial FCC License.
2. Then get a job in a two-way radio service shop and "learn the ropes" of the business.
3. As soon as you've earned a reputation as an expert, there are several ways you can go. You can move out and start signing up and servicing your own customers. You might become a franchised service representative of a big manufacturer and then start getting into two-way radio sales.
Cleveland Institute of Electronics has been successfully teaching Electronics for over 37 years. Right at home, in your spare time, you learn Electronics step by step.

CIE's ALTO-PROGRAMMED* Lessons remove the roadblocks by using simple, concise examples. You learn in small. compact steps - each one building on the other!

You'll learn not only the fundamentals that apply to all electronizs design and servicing, but also the specific procedures for installing, troubleshooting, and maintaining two-way mobile equipment.

## You Get Your FCC License... or Your Money Back!

Ey the time you've finished your CIE course, you'll be able to pass the FCC License exam. A recent survey of 787 CIE graduates reveals that better than 9 out of 10 CIE grads passed the FCC License exam. That's why we can offer our famous Money-Back Warranty: when you complete any CIE licensing course, you ll get your FCC License or be entitled to a full refund of all tuition paid. This warranty is valid during the completion time allowed for your course. You get your FCC License or your money back!

## It's Up To You

Mail the reply card for two FREE books, "Sucseed in Electronics" and "How To Get A Commercial FCC License." If card has been removed, mail coupon or write: Cleveland Institute of Electrorics, 1776 E. 17th Street Cleveland, Ohio 44114.

## APPROVED UNDER G. I. BILL

All CIE career courses are approved for educational benefits under the G.I. Bill. If you served on active duty since January 31, 1955, OR are in service now with more than 180 days of active duty, check box for G.I. Bill irformation.

Please send me your two FREE books:

1. Your book on "How To Get A Commercial FCC License."
2. Your new catalog "Sucteed In Electronics" describing the job opportunities in Electronics today, and how your courses can prepare me for them.
I am especially interested in:

T"HE LOUDSPEAKER is a relatively simple electro-mechanical device. But for most people, the manner in which it operates presents a mystery which has given rise to and perpetuated a number of peculiar fallacies. To describe a loudspeaker, we need very few words: It consists of a magnet assembly with a voice coil which drives a cone. The cone is elastically suspended in a metal frame in a manner which centers the voice coil cone assembly in the magnet assembly's air gap. Try describing the typical hii-fi receiver in as few words. It can't be done.

In spite of their complexity, receivers are fairly well understood. The same cannot be said of the loudspeaker. There are two reasons for this state of affairs. The first is that the input and output of a receiver are electrical signals which can be measured with a meter and observed with an oscilloscope. While the imput to a loudspeaker is an electrical signal, its output is an acous-
tical (sound) wave which radiates into the listening room in all directions and is reflected many times before it dies out. How then does one go about measuring the sound wave?

The second reason for the prevalence of false conclusions regarding loudspeaker design lies in the fact that the difficulty in grasping the theorv encourages intuition and experimentation. Unfortunately, intuition is frequently pursued along the wrong lines. As for experimenting-il loudspeaker will operate in some fashion in any kind of a housing, short of being imbedded in concrete; and someone may well like the resulting sound. This may account for some of the "revolutionary" developments that have appeared, the claims for which contradict some of the basic laws of physics.

In this article, we will be dealing with 50 of the most popular facts and fallacies pertaining to loudspeakers and speaker svstem designs. To cover as much ground as
possible, the article is being presented in two parts: Part I here; Pirt Il next month.

The first facts and fallacies have to do with the function that a loudspeaker is meant to perform.

1. A loudspeaker should "sound good."

Fallacy: The function of a loudspeaker is to reproduce, as acoustic energy, the electrical energy fed into it. It must be neutral, neither adding to nor sultracting from the original signal.
2. If I want to modify the sound to suit my oun preferences, I have a perfect right to do so.

Fact: Your preferences may vary from time to time and for different types of program material. It would make more sense to modify the sound by means of the amplifier's tone controls.
3. The Fletcher-Munson curves (see Fig. 1) show that the ear is less sensitive to the bass thall it is to the midrange audio frequencies. Hence, loudspeakers should hoost hass to make up for the characteristic.

Fallacy: A good look at the curves reveals that human hearing has less sensitivity to low frequencies at moderate or low sound levels. But if the same is true when listening to a live performance, it makes no sense at all to design a speaker with bass boost in an attempt to make up for the ear's deficiency when listening to a recording.
4. The previous statement implies that sound should always be reproduced with all frequencies amplified equally (flat response).

Fallacy: If we listen to reproduced sound at the same loudness level as that of the original, the frequency response should be flat. But a lower loudness level alters tonal balance as shown in Fig. 1. Suppose the original sound was at level A where the ear requires 2 dB more power at 50 Hz than at 1000 Hz for a given loudness sensation. If the reproduced sound level were at $B, 50$ Hz requires 12 dB more power than 1000 Hz for equal londness. There is now a deficiency of 10 dB , and the reproduction appears to be deficient in bass response. To restore tonal balance, 50 Hz must be boosted 10 dB as with a compensated loudness network. Since the amount of boost required is dependent on the volume level, the loudness compensation network should not be built into the loudspeaker where it would have a fixed characteristic. Also, loudspeakers should not be compensated to make up
for the deficiencies of human hearings as is so often stated.

Another set of facts and fallacies bas to do with loudspeaker size and shape and the material used to make the enclosure.
5. Musical instruments that produce low tones are large; therefore loulspeakers must be large to produce good bass.

Fallacy: The analogy is incorrect; musical instruments depend on resonance to produce low tones and they must be reasonably efficient so that they can be heard. Londspeakers do not generate sound in this sense; thev reproduce it, and efficiency is rather unimportant. A small loudspeaker can be designed to have bass response that extends as low as a large loudspeaker.
6. Large loudspeakers have advantages for bass reproduction.

Fact: Although this sounds contradictory to the preceding explanation, large speakers can be played louder without excessive distortion. They have higher efficiency so that they require less anplifier power.
7. Horn loudspeakers are better in the bass range than are direct radiators.

Fact: This is true only if the hom speaker is large enough, however. By this we mean that the horn speaker must have several times the cubic volume of a large directradiator speaker.
8. Loudspeakers should be shaped like the instruments whose sound they reproduce.

Fallacy: Ideally, perhaps something like this is true, at least for monophonic reproduction. The directional characteristic of reproduced sound might well he made to match that of the instrument sound reproduced, but when several different types of instruments are playing at once, thie principle is not practicable.
9. The shape of the loudspeaker should match that of the ear.

Fallacy: There is no conceivable basis in physics to support this statement. One might well ask, why not shape it like the mouth which at least produces sounds?
10. The type of wood used in making the enclosure has an important effect on loudspeaker performance.

Fallacy: The only requirement is that the enclosure be rigid and massive enough to prevent its walls from vilbating. The sole function of the box is to contain or provide a separate path for the sound wave coming from the back of the speaker.

Fig. 1. Fletcher-Munson equal loudness curves pertain to human hearing.
11. An clliptical speaker or linear array of speakers has wider sound distribution in the plane of its long axis.

Fallacy: According to Huygen's principle, each point of a sound radiator call be considered as a point source producing spherical waves with the combined wavefront tangent to these spherical wavelets. In Fig. 2 is shown how an array of small sources produces a narrow beam of sound. This elfect is used in sound reinforcement speakers (columns and line loudspeakers) to restrict the vertical spread of sound. The distribution angle is narrowed only for frequencies above the range in which the wavelength is comparable to the lengtl of the source. So, for better horizontal distribution, stand an elliptical speaker so that its long axis is vertical.
12. The shape of a speaker enclosure has an important effect on its frequency response.

Fact: Reflections inside the cabinet can reinforce or reduce response in many narrow bands of frequencies, producing uneven response. A long narrow box can act like an organ pipe, causing undesirable resonances. Overhanging front edges produce difliaction effects whereby sound waves following different paths interfere with each other. So can decorative grilles. The ideal shape for the front of a speaker box is something like a hemisphere-not exactly a shape to excite decorators or enclosure designers.

Regarding loudspeaker operation.
13. A loudspeaker has to move a lot of air, especially for good bass reproduction.

Fallacy: Speakers do not move air. What they do is cause local air molecules to vibrate back and forth, producing a wave-
front which spreads out and away from the speaker. There is no air how.
14. High frequencies are inherently directional, while lou frequencies are omnidirectional.

Fallacy: Omnidirectional waves are created by vibrating objects which are small compared to the wavelength of the sound being produced. If the dimensions of the vibrating object are several times that of a wavelength, the wave produced is nearly plane and progresses in a straight line without much spreading out. Since frequency is inversely proportional to wavelength, highfrequency waves are short in wavelength compared to ordinary speaker dimensions. Hence, the high notes tend to be directional. The converse is true for low frequencies.
15. A point solurce is associated wilh directionality.

Fallacy: A theoretical point source radiates sound equally in all directions.
16. We can determine the location of a Ioudspeaker in a room because that is where the sorme is coming from.

Fallacy: When listening to a typical speak$\mathrm{s}^{\prime}$ er the average room at a distance of, say, $S^{\prime}$, our ears actually receive most of the sound after it has been reflected one or more times from the foor, walls, and ceiling. The reason we can detect the location of the sound source is that sounds coming directly from the source reach our ears before the reflected sounds arrive. This is known as the Precedence Effect.
17. The ideal loudspeaker is one which behaves like a protect piston at all frequencies.

Fallacy: A uniformly vibrating diaphragm becomes directional in response in the upper midrange, and its sutput power drops of markedly. A perfect $10^{\prime \prime}$-diameter piston would be usable only up to about 800 Iz , which may be acceptable for a low-frequeney driver but not for a vide-range speaker. Even a $3^{\prime \prime}$ tweeter would be good only to about 3000 Hz . Speaker cones are designed so that their onter regions are progressively "decoupled" as the frequency increases, allowing smaller and smaller portions of the cone to vibrate while the rest of the cone area stands still as frequency goes up. In this manner, the speaker becomes effectively smaller to permit both response and directional characters to remain good. The upper frequence limit is, extended to about four times the piston sange.
18. A speaker placed at a junction of a wall and the foor has more bass oulput than one in the center of the floor or wall, and bass output is still further increased by locating the speaker in the comer of a room.

Fact: In the bass range, the reflections from the room surfaces occur in such a way that they are in phase with and reinforce the direct wave from the speaker. For higher frequencies, the times of travel along different paths differ in a random manner which does not permit this degree of reinforcement.
19. Some speakers must be driven hard to sound good.

Fallacy: The frequency response, directional characteristics, and distortion of speakers are never worse at low volume levels than when driven hard. Of course, a speaker that is somewhat cleficient in bass response will sound even more so at low volume, but this is because of the FletcherMunson loudness characteristic of the ear and not as a result of a property of the speaker.

Fig. 2. Each point of a line type of radiator produces a spherical wave, with the latter combining to produce a narrow beam at high frequencies.
20. High efficiency is desirable in a speaker.

Fact: A high-efficiency speaker demands less power from the amplifier for a given loudness than does a low-efficiency speaker But high-efficiency direct-radiator speakers tend to have less bass response than does the low-efficiency speaker
21. Speakers work best with amplifiers which have very higls damping factors.

Fallacy: Damping factor is a measure of the ability of an amplifier to keep the speaker cone from continuing to vibrate after the
signal has stopped. Very high damping factors can make some speakers lose bass response, especially high-efficiency direct rat diators. In theory, there is in optimum damping factor for each speaker design. But most speakers will work well with amplifiers which have moderately high damping factors, say about 10. Nothing is gained by increasing the clamping factor, and, in fact, amplifiers with very high damping factors tend to be somewhat unstable.
22. Speakers can be rated in terms of the minimum power required to drive them.

Fact: But this does not mean what it at first appears to mean. Speakers to not require some minimum power to produce sound. As power is reduced, the sound simply becomes less loud. So, minimum power refers to the minimum power required to drive a speaker to a loudness corresponding to average listening levels in an average listening room without excessive amplifier distortion on peaks. Although vague, the minimum-power rating is useful in guiding the user in choosing an amplifier; it is not the maximum power the speaker can withstand, which is expressed in terms of maximum power handling capacity. Actually, a speaker can be safely driven by an amplifier whose pover output exceeds this rating provided the volume control is never turned up to full capacity.
23. The power rating of a speaker indicales the maximum permissible power rating of the amplifier with which it is used.

Fact: This was pointed out above.
24. Hom-type speakers are more efficient than are direct radiators.

Fact: A hom acts somewhat like the transmission in an automobile. It enables the speaker to operate under more favorable conditions.
25. Because they are more efficient, homtype speakers take up less space than do direct radiators.

Fallacy: Efficiency has nothing to do with size. It involves only the ratio of power output to power input. It happens that for a given frequency range horn-tvpe speakers are more bulky than are direct radiators. This is one of the prices paid for higher efficiency.

This ends Part I of our discussion about speakers. In Part II, we will discuss 2.5 more facts and fallacies relating to this most often misunderstood device.

IN THE CENTER of Florida, about 15 miles southwest of Orlando, Walt Disney Productions has created what it calls the "Vacation Kingdom of the World." Its official name is Walt Disney World. In an area three miles wide and more than two miles long, Disney has built a complete theme park with resort hotels, water sports, and numerous other outdoor recreation activities.

While some of the 35 major attractions in the park will be lamiliar to the more than 100-million people who have visited Disneyland in California, manv more are unique to Disney World. The park is the largest recreation enterprise ever undertaken by a single company, costing $\$ 300-$ million as of the opening date. It permanently employs 10,700 people. Its parking lot capacity is 12,000 carss and there are 225 campsites, 4.5 miles of beaches, and two 18 -hole golf courses.

Disney World has many unique technological features also. For example, it has the nation's first officially designated STOLport designed for exclusive use by short takeoff and landing planes. And it has an all-electric elevated monorail transportation system which interconnects inajor areas, attractions, and accommodations.

Two major hotels or theme resorts are attractions in themselves. The 1057 -room Contemporary and the 500 -room Polynesian Village were built by U.S. Steel from preassembled rooms. The Contemporary is shaped like a hollow Mayan pyramid and has ag gigantic lobby appropriately called the "Grand Canvon Concourse." Monorail trains travel directly through this lobby to pick up and dehark hotel guests. Closedcircuit TV keeps conventioneers accommodated in the hotels in touch with business proceedings and schedule changes.

Information-Communication System. As you might expect, the electronic systems in operation in Disney World range from the conventional to the futuristic. RCA, the prime electronics contractor, has worked with the Disney people to plan and build the "first 21st Century information-communication system," providing instantaneous information on activities. Designed to serve both guests and park personnel, this electronic sustem-called WEDCOMMblends computer, telephone, automatic monitoring and control, mobile communications,
television, and wide-band systems into one totally integrated system.

One coaxial cable carries telephone traffic, automatic monitoring and control system signals, computer data, and the audio and control signals for the attractions.

## Telephone \& Mobile Communications.

 With the exception of a few miniature relays, the telephone system (built by Strom-
berg Carlson) is the mation's first all-electronic network. Some of its features, either currently in use or plamed, include: callback to tell you when a busy phone is free, 2- or 3-digit abbreviated dialing for numbers most frequently called; automatic transfer or following which allows calls to be transfered to any neighbor's phone while you are anvay; three-party calls; and utility meter reading by remote control.

Mobile commumications equiponent supplied by RCA includes sis fixed stations, 50 mobile units, and 150 portable personal size units. The equipment operates on five channels between 450 and 470 MHz with duplex service.

Hotel Room TV Receivers. Hotel TV receivers are comected to a unique master antemna television (MATV) system called DISCADE, built especially for Disney World by Ameco. In this system, a guest dials the chamel he wants. That channel and no other is transmitted to his receiver over a $6-\mathrm{MHz}$ bandwidth coaxial line from a central switching system. (By restricting the cable bandividth in this manner, dis-

## Electronics at Disney World

HOW ELECTRONICS IS
HELPING TO MAKE DISNEY WORLD A SUCCESS

BY EDWARD A. LACY
tribution amplifers are simpler and more care-free.)

Guests now have a choice of four channels, but the system can be expanded to 30 . Three of the channels provide local area TV programs; the fourtl channel gives hotel information.

The color TV receivers, built by RCA for Disney World, do not hase r-f tuners since down-converting is not necessary.

Computers \& Automatic Monitoring. Vicleo data terminals are planned for the Contemporary and Polynesian hotels to handle guest reservations, registrations, and checkouts. As a guest prepares to leave, for
instance, he could check out at any one of the data terminals located in the hotel lobbies merely by punching his room number into the terminal keyboard. The terminal would then automatically print out an itemized statement for pavmient at the cashier's window.

Presently, the terminals are comected by telephone line to RCA Spectra $70 / 45$ computers in Burbank, Calif.

A computerized automatic monitoring and control system built by RCA monitors the operating conditions of everything from fire alarms to golf course sprinklers. Should an equipment malfunction or an alarm condition such as a fire hazard occur, the system will identity the problem by flashing a coded message on video data terminals located at two fire stations, two security locations, and the maintenance console in the main service area.

Audio Animatronics. "Audio Animatronics," a patented Disney invention, is not part of WEDCOMM, but it is just as futuristic. Certainly, it is one of Disney's most important and popular contributions to the entertainment world. In this system, voices, music, and sound effects are electronically combined and synchronized with life-like movements of three-dimensional objects ranging from birds and flowers to humans.

Eight major attractions use Audio Anima-tronics-the Mickey Mouse Revue, the 36 Presidents in Liberty Square's Hall of Presidents, Country Bear Jamboree, Haunted Mansion, Sunshine Pavilion, Flight to the Moon, It's a Small World, and Peter Pan's Flight.

Essentially, the character movements are hydraulically actuated from electronic signals on magnetic disks. Characters in the foreground obviously are the most sophisticated and have the most elaborate circuits and functions. Mickey Mouse, for example, has 38 functions and even keeps time with the music.

In a typical 45 -minute show, there can be up to 1000 analog functions-character movements, stage effects. and sound effects. Signal routing is accomplished through the use of 250 binary addresses. To compose a show, an animator sits at the programming console of the digital animation control system which uses a general-purpose computer with a 32,000 -bit memory and activates the functions he wants. This informa-
tion is recorded on magnetic tape. Data on this tape is then copied on magnetic discs (up to four per show) which are used to play back the complete show. The tape itself is sent to Disney headquarters to be kept in a safe.

Future Plans. As exciting as these systems are, it should be noted that they are just the beginning. "We have additional projects and concepts on the boards for many years ahead," says Donn B. Tatum, President of Walt Disnev Productions. "We, can confidently say that there will always be something new for families to see and enjoy on future visits to Walt Disney World."

RCA, for example, is building a multimedia show to depict future advances in electronics and communications as thev will serve the consumer at home and away. The show, which will be in Tomorrowland, will feature Audio-Animatronic figures, movies. cartoons, three-dimensional effects, and holographic-type techniques.

Phase one of the master plan calls for development of the vacation resort over a five-year period. Later phases inchude a leisure-oriented residential community, a showcase industrial park, and, finally, EPCOT-the Experimental Prototype Community of Tomorrow.

EPCOT is planned to be a "living blue-
Programmers at work before a console that is used to control some 30 sep. arate movements. © Walt Disney Prod.

print of the future," a complete community of more tham 20,000 population. Here, new concepts and technologies will be introduced and tested, years ahead of their application elsewhere

To make it possible for Disney to do this, the Floridat legislature has passed 500 pages of special legisation, wiving the Reedy Creek Improvement District, which covers the Disney property, many of the powers of a county govermiment, including zoning, building codes, and the like.

Actually, the complete Disney site is the size of a small county. It takes in 4.3 square miles, an area roughly the size of San Francisco, or twice the size of Manhattan Island. The Magic Kingdom, hotels, golf courses, beaches, and campsites take up "just a sinall part of the Disnev acreage
"There's enough land here to hold all the ideas and plans we can possibly imagine," said Walt Disney back in 1964" "With the technical know-how of American industry and the creative inagination of the Disney
organization, I'm confident we can luild a organization, I'm confident we can build a living showcise that more people will talk about and come to look at than any othe area in the world."

## A

 PREAMPLIFIER for your SCOPE
## BUILD THIS

## X10 AMPLIFIER TO INCREASE SCOPE USEFULNESS

F-requently, when using an oscilloscope to check low-level signals, we wish that our scope had more gain. Suppose, for instance, that the scope's maximum vertical sensitivity is 50 mV (peak-to-peak) per inch or centimeter. With a typical lowcapacitance probe ( 10 megohns, 8-35 $\mathrm{pF}^{\text {F }}$ ) which has an attenuation of $10: 1$, one scope division may represent half a volt. Of course, the gain can be increased by using a straight-through probe instead of the lowcapacitance probe. Unfortunately, this may be impractical with a high source impedance or at high frequencies.
So how do we get higher gain? We use a scope preamplifier. The low-cost preamp whose schematic is shown in Fig. l can be used to fill the probe-sensitivity gap. It has a voltage gain of 10 and a bandwidth of about 5 MH z; and it can be used with any scope. The integrated circuit used was developed for the $45-\mathrm{MHz}$ i-f range in TV
and has high gain and low noise. With careful layout and choice of components, the bandwidth can easily be extencled to 30 MHz or more. The IC also has automatic gain control, which can be adjusted.

How It Works. The input connector (II) should fit the probe vou are going to use with the preamp. The output comnector (J2) is a BNC type, which should be used on the scope vertical input if it is not already there. If your scope uses a pair of banama jacks, now is the time to upgrade it with a good shielded coasial counector.

The input stage is a field-eflect transistor. It may be necessary to add extra capacitance (C2A) at the input, as discussed later under "Alignment." The signal at the source of $Q 1$ is comected to the imput of $I C 1$ through C3. Resistors $R 4$ and $R 5$ are the load resistors for the IC, and the output signal is taken from the non-inverting output

Fig. 1. Preamplifier circuit uses a commercial, high-quality $45-\mathrm{MHz}$ IC amplifier, with a FET input stage. The gain is adjusted by varying R6. PARTS LIST

at pin 8. Transistor $Q 2$ has a high input and a low output impedance and is used to couple the amplifier to the scope. The low output impedance helps to reduce the frequency limiting effect of the capacitance of the coaxial cable. The length of the output cable should be less than four inches-even less if you want to have a bandwidth of 30 MHz .

The de voltage at pin 5 of ICI determines the gain and, therefore, must be carefully adjusted. The upper end of $R 6$ is held at 12 volts by zener diode $D I$, but a variation of only a few millivolts on pin 5 will change the gain of the preamp. $S_{o}$ it may be necessary, after the unit is con-
structed to make adjustments easicr by reducing the value of $R 6$ and adding a fixed resistor on either side of the potentiometer. To do this, once the final gain has been adjusted, get an accurate measurement of the voltage needed at pin 5. Then use a $500-\mathrm{ohm}$ potentioneter for $R 6$ and add end resistors to make the total value 4000 or 5000 ohms. Since the IC supply is stabilized by $D 2$, the gain setting is stable at normal line voltage fluctuation.

Construction. The preamp is built in two separate sections: the amplifier in one shielded box and the power supply (Fig. 2) in another. The circuit shown in Fig. 1 is

Fig. 2. The 15 -volt, $85 \cdot \mathrm{~mA}$ supply to be used if not available elsewhere.
built on a $3^{3 \prime \prime \prime} \times 1$ an $^{\prime \prime}$ piece of printed circuit board. To minimize cirenit capacitances, wiring is without pins. The IC socket is mounted on the non-foil side of the board after first drilling the necessary holes. With the exception of pins 3 and 7 , all holes should have the copper cleared from around them. Use a larger lit (manually) to do the scraping. Note that ICI only uses pins one through four and 11 through 14 of a conventional 14 -pin in-line socket. Solder socket pins 3 and 13 ( $/ \mathrm{C} /$ pin 7 ) to the foil. All the other components are mounted on the foil side using point-topoint wiring of the component leads and the foil ats gromed.

The completed board is mominted with
 closure. Before installing the board, drill holes for input jack 11 , selector switch S1, and the power leads and coaxial cable. The last two holes must be fitted with grommets.

The power supply shown in Fig. 2 is optional if the required 15 volts at 85 mA is available elsewhere. However, if this supply is used, do not turn it on unless it is comected to the amplifier. Without D2, the supply cin reach about 36 volts, which
might damage electrolytic capacitor C10.
Alignment. Using a $10: 1$ probe as the input to the preamplifier, supply power and connect the probe to a source of 1 volt, peak-to-peak, at about 1 kHz . Adjust $R 6$ to obtain a l-volt peak-to-peak indication on the scope.

Now comnect the probe to a 0.5 -volt peak-to-peak spuare wave and place $S l$ in the DIRECT position. You should see a $50-\mathrm{mV}$ square wave on the scope. Adjust the probe frequenc-compensation trimmer capacitor for sharp corners without overshoot. Switch S1 on the preamp to the X10 position and adjust $C 2$ to obtain a clean square wave without overshoot. If $C 2$ camot be adjusted for the desired effect, add another small capacitor ( $C 2 A$ ) in parallel-try 33 pF . la some calses, the scope vertical input compensation trimmer may also lave to be adjusted.

If you now rephace the $10: 1$ prohe with a direct probe a $50-\mathrm{mV}$ signal will produce a 0.5 -volt deflection on the scope. The direct butput of a magnetic cartridge (approximately 5 mV ) call be sect easily on the 50 -mV input position of the scope's vertical mput.

Do not allow the do voltage at the input of the preamplifier to exceed the voltage rating of $C 1$ and do not apply more than 1 volt, peak-to-peak, to the probe if $S 1$ is in the Xl0 position.

If desired, the preamp can be built directly into the scope, with the scope's vertical gain switch changed accordingly. $\Delta$

The power supply is in one chassis (left) and the preamplifier in another.
Note how component leads in the preamp are soldered together for mounting.

# UCH-PLATE POWER 

## CONSTRUCTION OF

## A SWITCH THAT CONTROLS

UP TO 450 WATTS AT

THE TOUCH OF A FINGER

## SWITCH

BY JAY NUNLEY

0NE of the best features of electronics experimenting is acquiring the ability to make useful household devices. The TouchPlate Switch described here is particularly interesting since it can be used to turn power on or off merely with a touch of the fingeror the elbow, if a person's hands are full. The switch is activated by the ac field potential that is normally found on the human body-picked up from the power-controlled environment in which we live. This is the same field that shows up as a sine wave when you touch the vertical input of an oscilloscope or that makes an ac hum when vou touch the input connector of an audio amplifier. Although the signal can have a high voltage level, the associated current is extremely low.

Depending on the type of SCR used, the touch switch can handle from a few watts to several thousand watts. This also makes it very useful for stage lighting control where sharp on-off transitions are required.

Circuit Operation. Transistor Q1 (see Fig. 1) is an insulated-gate MOSFET having an extremely high input impedance. Voltage gain is not required in this circuit, but current gain and impedance transformation are. When the touch plate is contacted, the ac signal on the body is passed through the high resistance of $R 4$ to one gate of $(1)$. Resistor $R 5$ completes the input voltage divider. The total of $R 4$ and $R 5$ is about 20 megohms.

The source of $Q 1$ is connected to a voltage divider ( $R 3, D .3$, and $R 2$ ) at a point
that is about 4 volts positive. This makes the gate four volts negative with respect to the source so that, in the absence of an input signal, $Q I$ is fully cut off. The drain load ( $R 6$ ) supplies the trigger pulse for the toggle input of $I C 1$ and holds the $T$ input at about +2.5 volts. When the touch plate is contacted, the $60-\mathrm{Hz}$ field is applied to the gate of Q1. The positive peaks cause $Q 1$ to conduct at 60 Hz , with a negative pulse on the drain. Filter capacitor C.3 integrates the pulse to a smooth do to toggle the IC.

The J, K, and clear inputs of $I \mathrm{C} 1$ are connected to the common point because placing a logical zero on these inputs is the most direct way of setting up the flip-flop for simple toggling. Note however that the ground pin (4) of the IC is taken to the anode of $D .3$ in the voltage divider. The cathode of this diode is at the same voltage level as the source of $Q 1$; and, because the forward breakover voltage of $D .3$ is about 0.6 volt, this biases the source of QI negative with respect to the ground pin of $I C 1$. The nega-tive-going trigger pulses are thus assured of falling to zero or slightly below to provide a clean toggle.

Both the $Q$ and not-Q of $I C l$ are loaded by electrolytic capacitors $C 4$ and $C 5$. This is necessary for two reasons. First, the fall time of the input pulse is no faster than the 60 Hz signal used to drive the toggle input and is far too slow to trigger the fip-flop. The capacitors provide reliable toggling, even at a low rate. Second, since the power supply is not regulated, the capacitors give the flipflop some immunity to power-line transients.

The $Q$ output drives the gate of SCRI through R8, while the cathode of SCRI is comnected through $R 9$ to the not-(Q) output. Resistor R7 slightly biases the Q output to meet the vorst-case SCR triggering requirements. Thus, when the not-Q output is low and $Q$ is high, the gate of SCRI is forwand biased and the SCR is on. The next toggle pulse (when the touch plate is contacted) toggles $I C 1$ so that not-Q goes high and $Q$ goes low to turn off SCR1. Since the fan-out of ICl is limited, an SCR with a sensitive gate must be used for SCR1. Even so, up to

1400 watts of 120 -rolt ac power can be controlled, depending on the SCR used.

When SCRI is on, it applies power to the load and charges C2 through D2. During the next (reverse) half cycle, $C 2$ discharges through R1 and the gate and cathode of SCR2. Thus SCR1 and SCR2 supply power during alternate half cycles to provide fullwave ac power, up to 450 watts.

Construction. So that the touch switch can be installed within a conventional $3^{\prime \prime} \times$ $2^{\prime \prime} \times 2^{\prime \prime}$ metal junction bos (such as wall

Fig. 1. In switch circuit, the flip-flop in IC1 is triggered by MOSFET Q1 which has high input impedance. Two SCR's supply load power on alternate half cycles.

Note: Etched and drilled printed circuit hoards are available from Metrotec Electronics, Inc., 33 Cain Dr.. Technical-Industrial Park. Plainvieu. NY 11803, at $\$ 2.25$ rach bourd.

Fig. 2. Foil patterns for two printed circuit boards are shown above with component layouts below. Touch plate mounts in the center of small board.

switches are in), two PC hoards are used. These are shown in Fig. 2, with component mounting details.

The smaller board is built first, taking care that the electrolvtic capacitors and semiconductors are properly installed. Although most MOSFET's must be specially handled, the one called for in the Parts List has internal protection so it can be treated as any other transistor. Use a low-power soldering iron and fine solder. Before mstalling any components, be sure there is a small hole drilled through the board at the center for the touch plate mounting and contact screw (size 4-40).

After installing components on the larger board, make a heat sink for the two SCl's.
 aluminum bar (available at most hardware stores) and bend it into a $C$ shape so that it contacts each tal) on the SCR's and clears the transformer shell. Drill holes in the aluminum bat exactly opposite the SCR tab, holes. Use conventional power transistor insulation and silicone grease to attach the two SCR's to the ends of the heat sink.

The two boards can now be interconnected with short lengths of wire (just enough slack to permit board monnting) between similarly marked terminals. Comnect conventional ac leads to the neutral, hot, and load terminals.

Obtain a plastic cover for the junction box and drill a hole (for a $4-40$ screw) at the center. Drill two more holes $2^{\prime \prime \prime}{ }^{\prime \prime}$ apart along the center line and centered on the first hole. The touch plate can be any of a number of metal plates, medallions, etc. It must be metal, and any protective plastic coating must be removed. Use a $4-40$ screw long enough to pass through the touch plate, the plastic cover, and into the PC board. Since the electrical contact to the touch plate will be on the under side of the small PC board, fix the touch plate screw in place and use : nut to make the actual electrical contact. Another small mut is used to secure the small board in place.

Cut a small piece of cardboard or plastic sheet to cover the components on the small hoard. Mount the larger board over the sinaller one (over the insulation just installed) using 4-40 hardware through the other two holes in the plastic cover. Use $1 / 2 \prime$ insulated spacers. Check that the board-toboard intercomections are still good.

Test and Installation. Wire the unit in ac-

Bend a piece of aluminum to make heat sink for the SCR's.
cordance with Fig. 1, with the hot and nentral lines to the ac source and the load line to a 117 -volt lamp or similar load. Be sure that all exposed ac line connections are thoroughly insulated to prevent shorting or contacting.

When the touch plate is contacted, the load should go on. When the plate is comtacted again, the load should go off. If this does not happen, reverse the connections to the ac line

When the tonch control works properly, it can be installed in a standard wall conduit box. Before installation, be sure to shut off the power on that circuit by removing fuses

# TEST YOUR KNOWLEDCE OF SEMICONDUCTORS

5. The configuration used most often for a transistor switching circuit is:
(a) Common collector
(b) Common base
(c) Common emitter
6. Many mesa and planar transistors exhibit negative resistance after breakdown voltage is reached.
(a) True
(b) False
or throwing the circuit breaker. The existing wiring must be opened, with the touch switch installed-fully insulated-in accordance with your local electrical code. When you remove the wallbox plate, you will find a pair of wires coming from the main source, with the suvitch in series with the hot leadd. With all power removed from the circuit, renove the two wires from the switch, noting which one goes to the load and which gues to the main source. The one from the main source is the hot connection point. The one to the lamp is the load comnection. If you open the other pair, usually secured and insulated with a plastic nut, this is the neutral line. If there is no other pair, comnection to the metal box itself will provide the neutral side of the circuit.

If you have any doubt about the wiring conditions in your home or the proper way to install the touch switch, consult a protessional, licensed electrician. Attempts to do it yourself, unless you are sure, at this puint may lead to physical larm in case of shock and/or negation of fire insurance.
In operation, the unit may run slightly warm. This is nornal. The heat is similar tis that generated by many power dimmers found in modern lighting installations. ©

## 10 Reasons why RCA Home Training is

## your best investment

 for a rewarding career in electronics:

## 1LEADER In ELECTRONICS training

When you think of electronics, you immediately think of RCA ... a name that stands for dependability, integrity, and pioneering scientific advances. For over half a century. RCA Institutes, Inc., a subsidiary of RCA, has been a leader in technical training.

## 2 <br> hCa autotext teaches ELECTRONICS FASTER, EASIER, aLmost automatically

Beginner or refresher. AUTOTEXT, RCA Institutes' own method of programmed Home Training will help you learn electronics more quickly and with less effort, even if you've had trouble with conventional learning methods in the past.

WELL PAIO JOBS ARE OPEN TO MEN SKILLED IN ELECTRONICS
RCA Institutes is doing something positive to help men with an interest in electronics to qualify for rewarding jobs in this fascinating field. There are challenging new fields that need electronics technicians... new careers such as conrputers, automation. television. space electronics where the work is interesting and earnings are greater.

## 4WIDE CHOICE OF CAREER PROGRAMS

Start today on the electronics career of your choice. On the attached card is a list of "Career Programs", each of which starts with the amazing AUTOTEXI method of programmed instruction. Look the list over, pick the one best suited to you and check it off on the card.

## 5 <br> SPECIALIZED ADVANCED thaining

For those already working in electronics or with previous training, RCA Institutes offers advanced courses. You can start on a higher level without wasting time on work you already know.

## 6 personal supervision THROUGHOUT

All during your program of home study, your training is supervised by RCA Institutes experts who become personally involved in your efforts and help you over any "rough spots" that may develop.

## 7

## hands. On training

To give practical application to your studies, a variety of valuable RCA Institutes engineered kits are included in many programs. Each hit is complete in itself. You never have to take apart one piece to build another. They're yours to keep and use on the joh.

## 8 <br> FCC LICENSE TRAININGMONEY BACK AGREEMENT

Take RCA's Communications Career program-or enter with advanced standing and prepare immediately for your Ist, 2nd, or 3 rd class FCC Radio Telephone License examinations. RCA Institutes money-back agreement assures you of your money back if you fail to pass the FCC examination taken within 6 months after completing the course.

9

## CONVENIENT PAYMENT PLANS

You get a selection of low-cost tuition plans. And, we are an eligible insti-
tution under the Federally Insured Student Loan Program.

## 10 <br> RCA institutes is fully ACCREDITED

RCA Institutes is an accredited member of the National Home Study Council. Licensed by N. Y. State-courses of study and instructional facilities are approved by the State Education Department.

SI-Spst slide or toggle switch (optional)
Alisc.-Transistor socket (optional). 14-pin DIP IC sorket, transistor heat sink ( $\boldsymbol{H}$ ahefield NF 209 or similar), per! bourd, terminals, chassis. lamp lens (red), mounting harilware, etc.
Note-A set of all four semiconductors is available for $\$ 3.00$ from Semitronics Corp., 26.5 Canal St., New York, NY 10013.

zero. Pin 1 of $I C 1 A$, as well as pins 5 and 6 of $I C I B$ and 8 and 9 of $I C I C$ are at a higher voltage causing a lower voltage at pins 4 and 10 . In this case, current flows through $I /$ calusing it to light. Sections B and C of the IC are in parallel to permit sufficient current drive for the lamp.

When the voltage at $R 2 / R 3$ goes ahove 9 volts (battery charged up) or if the resistance of $R 4$ is increased so that the voltage on pins 2 and 3 exceeds about 1.7 volts, then the states of the gates are reversed and the output at pins 4 and 10 is high so that no current flows through the lamp.

Resistor $R 3$ serves to prevent shorting the IC input to ground if Rt is set to minimum resistance. Diode D2 is provided to insure that the IC input voltage never exceeds 5 volts since a higher voltage could damage the IC, especially over long periods of time. Since the IC is of the open collector type, resistors R.5 and R6 serve as pull-up resistors to maintain proper switching action of the IC.

Construction. The prototype was built on perf board as shown in the photo. though any other type of construction could be used. The board assembly was then mounted in a small chassis boo having loles for the adjustment of R4 and for the lamp. The board assembly should be isolated from the chassis box unless the car battery system is negative ground, in which case the box can be used as ground and must be firmly connected to the vehicle ground. Do not do this if the system has a positive ground.

It is important that a suitable socket he
used for the IC since its leads are short and heating them for soldering can cause damage. All of the components are soldered and wised in place before the IC and Q1 are installed. The transistor can be soldered direct if each lead is heat-sinked (with long-nose pliers) while soldering. The same technique is used in soldering DI and $D 2$. Be sure to use the heat sink called for in the parts list for Q1.

Installation and Adjustment. The voltage monitor can be mounted in any convenient location-just so the lamp can be seen. If switch $S 1$ is used, it and the lamp can be mounted separately with the rest of the unit tucked away out of sight. Another idea is to mount these components on the radio equipment panel so that, when the equipment is on, the monitor is also on.

Comect the monitor positive lead as directly as possible to the battery positive or to ground if the system has a positive ground. Connect the negative lead similarly. Of course, if SI is used, the ungrounded detector lead goes throngh the switch first. The detector can be permanently connected and on all the time since current drain is very low.

The voltage monitor is adjusted by using a variable do power supply with an output of at least 12 volts. Comnect the supply to the monitor as if it were the car battery. Using a voltmeter across the supply, reduce the voltage to what you consider to be the maximum battery voltage drop that would still allow you to start the engine. The prototype ivas set at 11.5 volts which ivorked well for engine starting. Then, adjust potentiometer $R \notin$ to the point where warning lamp il cones on. If the warning lamp comes on prior to adjustment of $R 4$, adjust R4 until the lamp goes out. Set the power supply voltage again, and adjust R4 again until the lamp comes back on. When the adjustment is satisfactory, either lock the potentiometer shaft or touch it with a bit of glue to keep it from moving.

As the car battery runs down to the monitor's triggering level, the warning lamp will turn on, telling you to start the engine to recharge the battery. Note that as soon as the engine starts, the lamp will go out since the charging system is at a higher voltage level. Either watch the car's ammeter or (if there is no ammeter) run the car for 10 to 15 minutes at a slightly fast idle to recharge the battery.

## Rise-Time

## What you see may not be what you've really got

SUPPOSE you feed the output of a pulse generator through a probe to an ascilloscope. You adjust the scope time base for a fast sweep. (This is the tupical setup for measurement of rise time.) The result is the easily recognized rise-time waveform shown in Fig. 1.

Question: If the time base is set for a sweep of 50 nanoseconds per division, what is the rise time of the generators output pulse-ignoring any inherent scope inaccuracies.
"That's easy," you say, quickly multiplying $50 \mathrm{~ns} /$ div times the two divisions covered by the pulse's leading edge. "100 ns is the rise time of the pulse. Right?"

Maybe yes; and maybe no!
Although 100 ns is the correct reading of the scope display, this value may not be the true rise time of the pulse. So ignoring scope inaccuracies, what other reason is there for suspecting that the measurement is not the real rise time?
Basically it is that, when the pulse passes through the probe, the scope amplifier, and even the scope CRT, it suffers rise time deterioration. Thus, the displayed waveform can't represent the true, original signal.

Although this is an unfortmate circumstance, it has one saving grace: it can be predicted. So, if you erroneonsly said that the rise time in the example was 100 ns , it should be both interesting and infomative to learn how to determine what the crror might be.

Fig. 1. Pulse rise time is measured between the $10 \%$ and $90 \%$ points on the leading edge of oscilloscope trace. In this case, rise time is 100 nanosec.

Rise-Time Formula. True rise time can he determined by the use of the tonguetwisting formula known as "the square root of the sum of the squares." In mathematical terns:
$\mathrm{T}_{\mathrm{RG}}=\mathrm{T}_{\mathrm{RD}}{ }^{2}-\mathrm{T}_{\mathrm{RH}}{ }^{2}-\mathrm{T}_{\mathrm{RO}}{ }^{2}$
where $\mathrm{T}_{\mathrm{i}}$ = true signal generator rise tune
$\mathrm{T}_{\mathrm{RD}}=$ displayed rise time
$\mathrm{T}_{\mathrm{kp}}=$ probe rise time
$\mathrm{T}_{\mathrm{RO}}=$ oscilloscope (amplifier and CRT) rise time
For a low- to medium-priced generalpurpose oscilloscope, a typical rise time is 35 ns.

For a standard probe, rise time is 5 or 10 ns . Putting these values into the formula, we get

$$
\begin{aligned}
\mathrm{T}_{\mathrm{R}} & =\sqrt{100^{2}}-35^{2}-10^{2} \\
& =93.1 \mathrm{~ns}
\end{aligned}
$$

Thus, the actual rise time of the generator pulse is 93.1 ns and not the 100 ns displayed on the scope; and the measurement was in error by 7.4\%.

It is important, therefore, to keep in mind that the displayed rise time is greater than the actual rise time. The amount of error is shown in Fig. 2, where per cent of error is plotted against the ratio of the input signal's rise time to test equipment rise time. In our example, this rise time ratio would be 9.3. I divided by the square root of $35^{2}+10^{2}$ or 2.56 .

Knowing that the measurement devices do introduce an error and with the aid of Fig. 2, you can determine just what error to expect. Conversely, to make a measurement within a given accuracy, Fig. 2 can be used to find what rise time response is needed in the test equipment.

More About Rise Time. We often concern ourselves with only the frequency response of an oscilloscope or an amplifier when, as we have scen, rise time is also important.

In using Fig. 1, we measured rise time between the $10 \%$ and $90 \%$ points of peak value on the leading edge of the pulse. These two points are used as standards for waveform measurement in the industry.

Fig. 2. Measurement error is inversely proportional to the rise-time ratio.

Looking at Fig. 1 again, you will note that the pulse rises linearly from the $10 \%$ voltage level to the $90 \%$ level. Such a characteristic is known as a Caussian response. When an ideal unit step pulse (one with zero rise time) is applied to an amplifier (or cascaded amplifiers) whose frequency response is RC limited, the response is Ganssian. For a Gaussian response, there is a relationship between rise time and frequency (also called bandwidth):
$0.35=\mathrm{t}_{\mathrm{r}} \times \mathrm{bw}$
where $t_{r}=$ rise time in microseconds
$\mathrm{bw}=$ frequency bandwidth in $\mathrm{MH}_{7}$
Oscilloscope vertical amplifiers consist of cascaded RC stages so the above formula applies. For instance, if a scope has a $10-\mathrm{MHz}$ bandwidth, its corresponding rise time would be 0.035 microseconds or 35 ns .

The 0.35 constant in the formula results from a combination of two factors:

RC rise time $=\mathrm{t}_{\mathrm{r}}=2.2 \mathrm{RC}$
-3 dB frequency $=\mathrm{F}_{\mathrm{C}}=1 /(2 \pi \mathrm{RC})$
Consider first the 2.2 RC factor and look at the universal time constant curve in Fig. 3. This curve will readily be recognized as the capacitor charging voltage in a series RC network with an applied ideal step pulse. Recalling that, in rise time measurements, the $10 \%$ and $90 \%$ points were used, we find the corresponding RC, value for these two points: namely 0.1 RC and 2.3 RC. Taking the difference belween these two values, we get 2.2 RC -the time in which rise time is resolved.

But wait just a moment! The curve in Fig. 3 is not Gaussian, so how can it be used in our calculations? Well, irrespective of Gaussian-or whatever-the universal time constant curve serves only as a reference
for the 2.2 RC value. It is not the signal pulse to be measured (as in Fig. 1) and thus does not have to be Gaussian.

Remember that what we did say about Gaussian response was that it pertained to an amplifier stage whose frequency response is RC limited.

This brings us to the second factor in the 0.35 constant: the $-3-\mathrm{dB}$ frequency, or the frequency at which an amplifier's gain is down 3 dB from mid-frequency gain. The influence of the stage's resistance and capacitance is shown in the $-3-\mathrm{dB}$ frequency formula: $\mathrm{F}_{\mathrm{c}}=1 /(2 \pi \mathrm{RC})$.

Having defined these two factors, let's see how they determine the 0.35 constant. First, transpose $F=1 /(2 \pi R C)$ into $\mathrm{RC}=$ $1 /\left(2 \pi F_{r}\right)$. Then from $t_{r}=2.2 R C$, we get $t_{r}=2.2 .\left[1 /\left(2 \pi F_{n}\right)\right]=0.35 / F_{c}$. Finally, $0.35=\mathrm{t}_{\mathrm{r}} \times \mathrm{F}_{\mathrm{c}}$. Or since frequency response is bandwidth, $0.35=t_{r} \times$ bw.

Fig. 3. This is time constant curve for charging capacitor in series RC circuit.

## The

## FIELD

## A VOCATION PROFILE OF AN IMPORTANT MEMBER OF THE COMPUTER FAMILY

BY STEPHEN A. KALLIS, JR. Digital Equipment Corp

BARRY OTT is a field service representative for Digital Equipment Corporation, or $D E C$, a major manufacturer of electronic computers. With approximatey 18,500 computers mamufactured by DEC located throughout the Free World, and on the high seas, it is important for the company to have a trained staff of specialists who can service the computers. Ott works at a DEC ficld service facility, one of 120 located across the U.S., through most of Western Europe, and iu Canada, Japan, and Australia.

DEC's computers can be found in a wide varicty of environments, from sedate airconditioned business offices to oil fields, luxury ocean liners, steel mills, or baseball stadiums. Consequently, Ott's equipment is compact and highly probtable. When he goes on a job, he generally takes a tool kit in a small suitcase-size carrier, a portable oscillascope, a set of solid-state components capable of being used to repair the majority of DEC modules (logic cards) in the field, spare modules, and a set of computer tapes to permit him to rim performance checks at the computer site.

The range of different situations that Ott encounters is quite large, primarily because his company's customers vary in degrees of sophistication. $S$ mo customers can perform maintenance without outside aid. They call
for a field service representative only when something major happens to the system.

By contrast, most customers are less knowledgeable about computers. Many view computers as "black box" solutions to their problems. And even among those who have programming experience, the ability to repair their computers is limited. Just as the average niser of a tape recorder or TV receiver does not need a detailed understanding of the "works" to operate it effectively, many users of computers are in the dark when it comes to knowing just how the system operates.

A Professional Consultant. There are two ways that a man who is called in to correct a malfunction can be viewed: as a repairman or as a professional consultant. The field service representative belongs in the latter category. Before a man can become a fiold service representative at DEC, he is screened carefully. He must have at least an Associate degree or the equivalent. Further, he must have broad experience in some phase of related electronic activity, preferably with experience in such items as computer core memories, magnetic tape units, disk storage systems, etc.

The screening process also includes a written examination on basic computer tech-

Starting out on a typical field service call, the representative carries all the tools of his trade to his car. In his right hand are three boxes containing component parts to repair computer logic modules and his tool kit. An attache case with the computer programs and a portable oscilloscope make the rest of the load.

> Compact tool kit contains variety of items for mechancal inspection, assembly, and disassembly. In addition to tools, there are lubricants, etc. Probes and leads are in box at right.

nology, covering number systems, Boolean algebra, and basic circuits-in short, the aspects that a field service man must be familiar with to function effectively as a computer professional.

The applicant for a field service position is interviewed and evaluated in several ways. In addition to a session with the persomel department, he is interviewed by a field service office manager and by a technical specialist. It is important to determine whether or not he really knows what the joh entails and that he has the aptitude to perform the tasks required of a field service man. Also, the interviewers are interested in how the applicant reacts under pressure, his attitude toward working long hours on a particular joh, and his willingness to travel.

Bary Ott is an example of the type of person who finds field service work exciting. A graduate of high school and teehnical school, he had six years of technical service in the U.S. Navy. He worked on analog and digital computers, with an assignment to maintain 24-bit general-purpose computers. During his 15 months of Navy training, he achieved a standing of 86 percent in his class. By the time he applied to DEC, he lad a thorough understanding of computers and their peripheral devices.

Special Problems. Although the vast majority of problems is well within the ability of a field service man to cope with, there is a small percentage of problems which requires special training. The company realizes this, and it backs its field service representatives with field service support specialists. A support specialist has an intimate knowledge about a particular computer type or system configuration. It is his job to tackle the problems that defy ordinarv servicing. A field service representative like Ott might wish to become a field service support specialist as he progresses within the company

DEC also backs up the field service support specialist. If there is a need, the company will bring in as consultants the engineers who were responsible for designing the computer system. Although this is extremely rare, it has happened. Thus, when a field service representative like Barry Ott represents his company, he does so knowing that he can be supported on those occasions when the problem he encounters is beyond the scope of his expertise.

Unlike the support specialist, Ott is a
"generalist," with an understanding of a wide variety of computers and peripheral devices. Even though a generalist leans about a lot of different computers, he tends to lean more toward certain machines than others, as his interests dictate. Thus, if he wishes to specialize, he may find himself in a position to train to become a field service support specialist in those computers which interest him.

A Typical Day. A typical day in the life of Barry Ott starts at about $8: 15 \mathrm{a} . \mathrm{m}$. when he checks the status board at the field service office to determine what is scheduled for the day. Knowing with what machines he will be involved, he checks to make sure that he has the correct programs and servicing manuals for the job. He then makes sure that he has all the hardware and tools necessary.
For all practical purposes, all the computers and systems that Ott will be called upon to service are located geographically close to him. This is true for most field service representatives. Only in a region of sparse population where the field service regional territory is naturally larger, or in a region that does not normally have a field service office, will a representative be asked to travel any appreciable distance.

One interesting example of an unusual case was when several minicomputers were installed aboard ships that had to leave port before the complete maintenance routine could be completed. For the next day or so, the field service representative found himself at sea while he finished up. Thus, a field service representative has what amounts to his own territory. In Barry Ott's case, it is the greater Boston area.

With regard to his future, if Ott decides to become a support specialist, he will be required to do more extensive traveling since there is no one territory that will be likely to contain sufficient models of any machine or machines to justify an exclusive support specialist.

Ott understands the characteristics of the computers within his territory. As a result, he knows many of the things to expect when visiting his well-established customers. This in turn helps him to plan his sclredule to permit him to work at maximum efficiency.

A routine call generally lasts 2-3 hours, permitting Ott to perform preventive maintenance to ensure that the computer will not malfunction at a critical time and allowing him to make minor repairs should these be necessary. In addition to looking

In the event that a completely assembled logic module is not available in stock at the field service office, the components kit permits representative to repair the majority of modules in the field. Because of the tight and compact packaging of parts, soldering must be performed carefully.
at the computer itself, Ott must look after the entire system, including teletypewriters, storage and display devices, and line printers.

The field service representative performs a very useful function. His ammal salary ranges from $\$ 8000$ to $\$ 12,000$, and he generally gets time-and-a-half for any work performed in excess of 40 hours per week. The field service support specialist or field service engineer, who generally specializes in one particular type of equipment, is salaried at $\$ 9000-\$ 14.000$ a year. A slightly higher technical level product support engincer is salaried at $\$ 10,000-\$ 16,000$ a year.

Most of the computers which a field service representative works with are used in a variety of jobs that are "on line;" that is, they are connected directly to an instrument or process. When a computer is being used to monitor the vital processes of a patient in an intensive care ward of a hospital, or when a computer is used to switch messages between aircraft in Hight, the owner cannot afford to have it malfunction. By using men like Barry Ott who have an enthusiasm for working on computer systems, DEC's field service organization can be assured that the company's computers will always be working at the peak of their performance capabilities. And the field service representative finds himself in a highly satisfying line of work.

By Richard Humphrey

IF REPUTABLE sources can be believed, the Federal Communications Commission will release shortly a proposal which will require all transmitters, including $C B$ amateur, marine, aeronautical, etc., to have a tamper-proof, permanently installed, inte-grated-circuit module which will automatically identify a station without the operator's even being aware of it.

The identifier module will be mounted in a 24 -pin plastic package $1.2^{\prime \prime} \times 0.6^{\prime \prime} \times$ $0.185^{\prime \prime}$ and will transmit every thirty seconds a three-letter, four-number, "coded-for-computer" binary "blip" lasting $5-7$ milliseconds. This seven-character identifier is capable of over 78 billion combinations.

Obviously aware of possible adverse reactions from the communications community the FCC has been emphatically denving it plans to release a Notice of Proposed Rule Making making automatic identification of transmitters mandatory. Unfortunately, the $\mathrm{FCC}-$ excellent at supervising the airwaves -has trouble hiding its tracks.

Item: In June of 1970, Daniel K. Child (Chief, Aviation \& Marine Division, FCC) told the writer "we are presently looking for an automatic identification system to be used in the maritime mobile service."

Item: On July 17, 1970, Curt Plummer, Chief of the FCC's Field lureau said: "Identification of two-way radio stations must, in the long rum, be taken ont of the hands of the individual operator."

He then went on to discuss in depth the automatic ID methods the Commission was studying (the "continual rumming" ID) using frequencies of 40 to 300 Hz keved at a 25 word-per-minute rate; the "burst" method triggered when the microphone is keyed) and the problems the FCC was encountering.

Item: Without exception, manufacturers of integrated circuits-among them, Texas Instruments, Motorola and Sylvania-have
admitted that the FCC has been in contact with them for assistance in developing in automatic ID system.

Two Important Discoveries. Then-on March 20, 1972-two important discoveries were made. One was a document which discussed in detail the FCC intention of amending certain rules and regulations "to provide a mandatory system for automatic identification of transmitters (ATIS) used for radiotelephony other than those used for radionavigation." The other was a photograph of what will probably be the 24 -pin integrated circuit module.

The document-dated July 9, 1972states that "the Commission has developed the system for rapid automatic identification of tramsmitters" and that it will be "binary coded in USA Standard Code for Information Interchange (USASCII) which (will be) transmitted automatically at the end of each transmission, or at intervals of approximately thirty seconds in the case of longer transmissions, at a rate of 600 bits per second."

The FCC, says the document, is using only a portion of the USA Standard Code grid. The letter " $K$ " in the USASCII would

## Automatic Identification of <br> Transmitters

be transmitted as "1001011(1)". The number in parenthesis is the "parity bit" which is transmitted to give an odd number of I's so that the computer will accept the signal as being valid.

An FCC monitor station or prowl car will-when the system is operational-record the binary ID of a violator, feed the information into its computer, and come up with the name and address of the licensee in a matter of seconds. The entire signal sequence will comsist of the prefix "SYN" sent twice (this synchronizes the computer to the ID signal), then the seven-place dentifier. Finally, "ETB" (End of Transmission Block) is sent twice. Each bit pattern will have a parity bit added. Thus, the automatic ID signal of the mythical call "WBN-2703" in binary form would be:

| SYN | $0010110(0)$ |
| :---: | :---: |
| SYN | $0010110(0)$ |
| $W$ | $1010111(0)$ |
| $B$ | $1000010(1)$ |
| $N$ | $1001110(1)$ |
| 2 | $0110010(0)$ |
| 7 | $0110111(0)$ |
| 0 | $0110000(1)$ |
| 3 | $0110011(1)$ |
| ETB | $0010111(1)$ |
| ETB | $0010111(1)$ |

One of the suggestions offered by the industry is that "ETB" be changed to "ETX" ( $00000011(1)$ )-End of Text-to make it more distinctive and avoid conmuter confusion. Since the prefix and suffix symbols will appear in all automatic II signals, they will probably be permanently programmed into each IC by the semiconductor maker. The three-letter, four-number portion will undoubtedly be programmed into the IC by the manufacturer of the transmitter since the FCC document calls for the identifier to "be installed in each transmitter by the manufacturer of the transmitter".

Comments from Manufacturers. Here's what's facing the transmitter manufacturers in this program. They will have to: buy the integrated circuit; buy the equipment to program the IC; train personnel to do the programming; program and install the IC; assume the responsibility of correctly matching-by card or plate attached to the transmitter or by some other foolproof means-the transmitter to the ID code; and apply for type-acceptance of their transmitters and describe "the measures em-
ployed to limit or preclude the capability of field or servicing persomel to adjust the functions or to change the . . identifier."

Comments from equipment manufacturers interviewed ranged from, "We think the FCC is out of its mind," through, "It'll be a mountain of paperwork but I suppose we'll have to do it," to, "We intend to file a comment in support of the measure".

There's nothing much facing the semiconductor manufacturers except deciding whether they want the money in large bills or small ones. With basic research already behind them and a potential multi-million unit market, they aren't complaining.

What About the End-User? Here's what's facing the end-user: an inevitable increase in equipment cost. One industry source says that any cost to a manufacturer is usually reflected by a 3.2 increase in the over-the-counter price. This means that if the antomatic ID integrated circuit costs a transmitter manufacturer $\$ 10$ including installation, equipment amortization, etc., the man who buys a CB set or a ham rig or what-have-you will pay $\$ 32$. In a $\$ 100$ piece of equipment, this represents a $32 \%$ increase in price.

Reactions from user groups are as varied as those encountered from equipment manufacturers. An increase in equipment cost irked those interested in lower-priced units (CB'ers, many hams). After all, a $\$ 32$ increase in a $\$ 100 \mathrm{CB}$ rig is quite different from a $\$ 32$ increase in a $\$ 900$ transceiver. The commercial marine vessel owners welcomed the news as did land-mobile operators. These groups seldom give their callsigns because of the press of business but would just as soon be legal. Operating procedures of airline and private pilots wouldn't be changed. They've got to voiceidentify to keep one another sorted out. Pleasure boat owners were the most reactionary ("I'll tear the damned thing out! I dare "em to put me in jail!").

Tamper-Proofing Problems. Taniperproofing will present problems. Technicians who have no qualins about "hopping up" a $C B$ set for $\$ 10$ under-the-counter aren't abont to be fazed by a programmable read-only-memory IC. The semiconductor industry offered two programming methods to the request the FCC didn't make. One uses the "fuzable link" technique which, once programmed, cannot be changed. The
other method uses an electrically implanted negative charge which acts as a barrier (giving a " 0 ") in a so-called "floating gate". The advantage of this method is that the IC can be completely tested prior to use. Then it is erased and sent on to the equipment manufacturer. The only trouble: The IC can be erased by merely exposing it to ultraviolet light or X-rays-an open invitation to the unscrupulous technician.

With all these problems it's mo wonder the FCC doesn't want anyone to know about its no-Notice of Proposed Rule Making. If it thinks the refusal of ant engineer for a major semiconductor firm to work on the project ("It smacks of Big Brotherism.") or the opinion of a major commmications equipment manufacturer ("It makes about as much sense as gun control laws: the violators will go on violating while the rest of us have given up some more of our rights!") are jibes from a small group, wait until the general communications public hears about it. This is the public that's going to be footing the bill for this trip into 1984.

## LOW-BUDGET RADIOTHERAPY UNIT

Radiation therapy technician Cain Chan of Memorial Hospital, Modesto, Calif., makes an adjustment of a Varian Associates Clinac (TM) 4 linear accelerator for cancer radiation therapy, which was recently installed at the small community hospital. Advanced microwave techniques and solid-state electronics have been used to provide a fully mechanized, easily operated unit, specially designed for small hospitals and treatment centers. Radiation intensity is up to 350 rads/minute.

# MAC'S SERVICE SHOP Shelf Life of Capacitors \& Batteries 

By John T. Frye, WgEgV, KHD4 167

MAC was so busily engaged in what he was doing at the workbench that he actually jumped when he heard the voice of Barney, the second banana of the shop, who had entered quietly and was standing behind him.
"So! You sneaked out and bought something new!" Barney was saying accusingly as he levelled a finger at the impressive little black instrument, bristling with pushbuttons, dials, switch knobs, a magic eye tube, and a large meter sitting on the bench surrounded by all sizes and shapes of capacitors. "What is it?"
"A Sprague Model TO-6 Tel-Ohmike Capacitor Analyzer," Mac answered. "The other day I replaced a $0.1-\mu \mathrm{F}$ coupling capacitor in a tape recorder with one from our stock and found the new one had less insulation resistance than the one replaced. I tried three more of our capacitors, and every one showed objectionable leakage, but a fourth was fine. Right then I decided we needed an accurate method of evalnating capacitors we planned to install in critical locations. The fact that a capacitor is unused obviously does not mean it is good. Moreover, many surplus capacitors can be purchased today at such tempting prices that they represent bargains-if we have a means of separating the sheep from the goats. This little instrument is just the ticket for telling us all we need to know about surplus capacitors or the ones we get from our jobber.
"It measures capacitance from 1 pF to $2000 \mu \mathrm{~F}$, and the applied voltage is low enough that capacitors rated at 3 V can be tested without clamage-an important point with capacitors designed for transistorized equipment. The power factor and leakage current of electrolytics can be accurately measured at their exact rated working voltage. Finally the insulation re-
sistance of paper, ceramic, and mica capacitors can be read directly on a meter with two ranges: one up to 10,000 megohms at 30 V for low-voltage capacitors and the other up to 50,000 megohms at 150 V for higher voltage types. Incidentally, those leaky paper capacitors of ours have insulation resistance of less than 2 megohms, while they should have a minimum resistance, when new, of 5000 megohms. This is according to data given in the TO-6 operating manual as to what constitutes minimum insulation resistance for all types and values of paper, mica, silver mica, ceramic, oil-filled, subminiature capacitors, etc."
"We must have got a bummer batch of $0.1-\mu \mathrm{F}$ capacitors, huh?"
"I doubt it. Those capacitors were probably OK when new but simply deteriorated in the bin. I have no idea how long thev've been there. We don't use many $0.1-\mu \mathrm{F}$ 600-V units any more, and I have the bad habit of ordering new paper capacitors when any one type is rumning low and dumping the new ones in on top of the old. Then I use the new ones off the top of the pile and leave the old ones down at the bottom; and I do this over and over. We're going to quit that."
"You think paper capacitors go sour on the shelf?"
" "Nothing good nor bad lasts a hundred years,' the Spanish say. All things deteriorate with time-except service technicians, of course! At any rate, I became curions about the shelf life of several items we use regularly and dashed off letters to capacitor, battery, tube, and solid-state manufacturers asking them for information as to the shelf life I could reasonably expect from their products, what conditions affected shelf life, and what recommendations they had regarding storage.

Returns are still coming in, but I atready have a good response from capacitor and battery manufacturers. After all. they know that customer satisfaction and confidence comes from installing components when they are new and fresh. Trying to use an over-age, gone-sour component breeds dissatisfaction. no matter how unfair that feeling may be."

Shelf Life of Capacitors. "Okay, so what have you learned about capacitors?"
"I've learned the nomal shelf life for paper tubular capacitors used in TV/radio is about five years, as is the nomal shelf life for micas (both dipped and molded) and small ceramic capacitors. The decrease in insulation resistance with time takes place chiefly in the diclectric material. Heat and moisture are great villains in this regard. Every effort is made to seal moisture out of the capacitors, and modern techniques do a good joh of this; but if the capacitors are exposed to temperature eycling monder conditions of high humidity, some moisture is eventually bound to penetrate the scals and degrade the insulating quality of the dielectric."
"Then these capacitors should be stored away from heat and moisture."
"Right. As one capacitor manulacturer wrote me, 'I suppose that one way of looking at it would be for you to keep the capacitors under conditions similar to that under which your wife would keep spices -not near any heat, such as a stove or radiator, and as dry as possible. You and I can believe this because we both know that when we get a radio in for service that has been stored in an attic or basement, we are certain to find seseral leaky capacitors in it."
"How about dry electrolytics? Should they be stored inder the same conditions?"
"As far as kecping them atway from high temperature, yes; but here we are not so much concerned with kecping the moisture out as keeping it in. Let me explain. A dry electrolytic really might be called a 'damp' electrolytic because the electrolyte inside it is in the form of a moist paste. The actual dielectric is a verv thin oxide film that normally forms throngh the combined action of an applied voltage and the chemical action of the electrolyte. The anode constitutes one plate of the capacitor the electrolyte forms the other. Therefore the drying ont of the electrolyte

CIRCLE NO. 36 ON READER SERVICE CARD
destroys the capacitor, and the presence of heat speeds up this drying process.
"Manufacturers seem to agree that the normal shelf life for de electrolytics is one to two vears. However the drying up of the electrolyte is not the limiting factor here as much as is the gradual deterioration of the dielectric film under the eroding action of the electrolyte when no polarizing voltage is present to maintain that film. The life of an electrolytic capacitor on the shelf can be materially extended if a polarizing voltage is applied to it through a current-limiting resistor everv few months. Heat increases the chemical action of the electrolvte on the oxide film under storage conditions and shortens the normal shelf life."
"What happens if the capacitor is stored at extreme low temperatures?"
"The series resistance goes up and the capacitance goes down due to ionic immolility because of the freezing of the ionizing agent. Capacitors that have been out of service at extreme low temperatures react as though open circuited at first but start returning to normal with the temperature rise of the equipment."

What About Batteries? "Okay, now tell me about the shelf life of batteries. Transistorized equipment has made this an impartant subject."
"I'm indebted to Union Carbide, maker of Eveready Batteries, and to RCA for the information I have on this subject. Union Carbide defines the shelf life as the period of time, at al storage temperature of $70^{\circ} \mathrm{F}$, after which a given hattery retains $90 \%$ of its original energy content. Shelf life is reduced by high temperatures because of wasteful zinc corrosion and side chemical reactions within the cells and because of moisture loss from the cells through evaporation. The shelf life of a battery stored at $90^{\circ} \mathrm{F}$ may be $1 / 3$ that of one stored at $70^{\circ} \mathrm{F}$.
"RCA has conducted some interesting tests on the effect of temperature on sheif life of carbon-zinc cells. For example, an A-size carbon-zinc cell stored at $70^{\circ}$ for 24 months retained only $50 \%$ of the rated capacity, but cells stored at $45^{\circ} \mathrm{F}$ and $0^{\circ} \mathrm{F}$ retained $70 \%$ and $90 \%$, respectively, of their rated capacity. Other tests showed carbon-zinc cells stored at $48^{\circ} \mathrm{F}$ were in better condition at the end of five years

In the important upper audio frequencies, some cartridges suffer as much as a $50 \%$ loss in music power.

So, there's a lack of definition in the reproduction of violins, oboes, pianos, and other instruments which depend on the overtones and harmonics in the upper frequencies for a complete tonal picture.

The Pickering XV-15 cartridge delivers $100 \%$ Music Power $100 \%$ of the time. Which is why we call it "The $100 \%$ Music Power Cartridge." A: $100 \%$ Music Power,
all the instruments are distinct and clear, because Pickering XV-15's have no musicrobbing output drop anywhere in the audio spectrum.

Pickering XV-15 stereo cartridges are priced from $\$ 29.95$ to $\$ 65.00$, and there's one to fit anything you play records with. For more informalion write: Pickering \& Co., Inc., Dept. E, 101 Sunnyside Blvd., I'lanview, L.I., N.Y. 11803.

PICKERING
"for those who can hear the difference
than those stored at $104^{\circ} \mathrm{F}$ at the end of one year.
"UC says the shelf life, as defined previously, of silver-oxide, mercury, or alkaline batteries is one year. The shelf life of carbon-zinc batteries is slightly less than that. Other types of batteries mentioned do not benefit as much from cold storage as do the carbon-zine cells.
"RCA, on the other hand, while agreeing on the shelf life of silver-oxide cells, finds mercury cells have a shelf life of two years and that alkaline cells have a shelf life almost as good. RCA further states that the shelf life of mercury cells can be extended by storing them at lower than room temperature, provided suitable precautions are followed. Since both companies concur in these precautions, let me list them: (1) Don't handle frozen batteries any more than necessary and be gentle with them to avoid cracking the internal and external seals which may become brittle at low temperatures. (2) Allow the cells to reach room temperatures in the containers in which they are stored to avoid excessive condensed moisture, which will generally destroy the jackets and increase electrical leakage. (3) Do not put the cells into service until they have reached room temperature."
"How about recharged primary cells? Is their shelf life as good as it was originally?"
"Definitely not. RCA says such recharged cells have a very poor shelf life and should be put into service immediately after recharging."
"Well," Barney said, "this certainly has convinced me that capacitors and batteries should be purchased from a source that moves these items rapidly and keeps a close tab on how long they have been on the shelf. By the same token, we should buy in small enough quantities that they will not be long on our shelves. And we should work on a first-in-first-out basis. But now tell me about the tubes and transistors."
"I'm afraid that is going to have to wait," Mac said, starting to put the capacitors he had finished testing back into their bins. "I haven't heard from all the people I wrote to in those fields yet, and it is high time we got to work. But I promise that someday soon well talk about the shelf life of tubes, transistors, IC's, etc."

# Changes come fast in electronics. 

Take a look at the race in circuit technology. In the 1960's the tubes at the left made way for the transistors at the right. Today, transistors are surpassed by the large scale integrated circuit (LSI) at the far right. This circuit, less than a quarter inch square, replaces over 6000 transistors!
There's big money to be made by the men who stay ahead of this technology race. Put yourself
ahead with NTS Home Training! You get the latest, most advanced equipment (at no extra cost). More solid-state units, and more advanced technology. Plenty of training with integrated circuits, too! As an NTS graduate, you enter a world of electronics you're familiar with. You have a thorough working knowledge of solid-state circuitry. You're ready to tackle bigger jobs at higher pay!

NTS COLOR AND B \& W TV SERVICING

Build and keep the largest, most advanced color TV made! Over-all solid-state design, ultra-rectangular screen, matrix picture tube, built-in self-servicing features, "Instant On," A.F.T., solid-state, 24-channe1 detent UHF/VHF power tuning, and much more! Also build and keep AM-SW Radio, Solid-State Radio, FET Volt-Ohmmeter, and Electronic Tube Tester. Learn trouble-shooting, hi-fi, stereo, multiplex systems, radio, color and B\&W TV servicing.
Learn sophisticated solid-state circuitry as you build this B \& W TV receiver. Lo-Silho "Superhet" Radio, FET Volt-Ohmmeter, SolidState Radio, Electronic Tube Checker, and Signal Generator. TV
and all other equipment are yours to keep.

## NTS ELECTRONICS \& COMPUTER TECHNOLOGY

Build and keep this exclusive NTS Compu-Trainer. It teaches you the

same principles used in milliondollar systems. Contains 14 inte-
grated circuits! All Solid-State! You perform all wiring and patchcording. No shortcuts. No pre-wired circuit boards. Your training is complete! Also receive an FET VoltOhmmeter and a $5^{\prime \prime}$ wide-band Solid-State Oscilloscope.

## NTS ELECTRONICS COMMUNICATIONS

Gain the prestige and earning power of owning an F.C.C. First Class Radio-Telephone License. Two comprehensive NTS courses cover the big opportunity field of transmitting and receiving.
You build and keep 14 kits, including this amateur phone 6 -meter VHF Transceiver, NTS's exclusive 6 -transistor Solid-State Radio, and a fully transistorized Volt-Ohmmeter. Also, learn 2 -way radio, Citizens Band microwaves, and radar.

5-watt AM transmitter/ receiver

高

## NTS INDUSTRIAL \& AUTOMATION ELECTRONICS

Automation is the future of industry and you can play an important part! Learn industrial controls by training on the NTS Electro-Lab (a complete workshop). You also build and operate this 5 " Solid-State oscilloscope. And you perform experiments that involve regulating motor speeds, temperature, pressure, liquid level. and much more. All equipment is yours to keep.

## NTS AUDIO ELECTRONICS SERVICING

Learn basic sound theory-how it works in home radio, car tape
decks, stereo multiplex component systems, and more! Set up a spectacular music system. Learn about

sound distortion, amplification and control, loud-speaker baffles, problems of system installation, etc. Included is Volt-Ohmmeter, In-Circuit Transistor Tester, and Solid-State

Radio. Prepare yourself for great opportunities in the Home Entertainment Industry!

# The Field-Effect Transistor 

## WHAT IT IS AND HOW IT HAS

REVOLUTIONIZED ELECTRONICS
BY WILLIAM R. SHIPPEE

EVER since its introduction, the fieldeffect transistor has been creating quite a stir in electronics. Devices and systems heretofore impossible to produce with bipolar transistors had to be built around vaccuun tubes-if at all. Now, the FET is changing the situation.

The FET has many of the qualities and advantages of both the vacuun tube triode and the bipolar transistor. It is as compact as most small-signal transistors. It operates at low voltages, thus eliminlating most of the bulk ind expense of the power supply. Its input impedance can be rigged to fall into the desirable multi-megolm category. Recent developments have produced FET's which are capable of dissipating several watts of power; and since they exhibit the property of having a negative temperature coefficient, it is hard to make them succumb to thermal runaway.
Viewed as a design element, the FET is a semiconductor device which behaves in the manuer of a variable resistor. As shown in Fig. 1, current flow between the source and drain is controlled by the gate voltage which is applied to both p sections simultaneously. As the reverse bias increases, the space charge area starts to pinch off, causing the source-to-drain current to fall almost to zero. Thus, the gate "field" has a direct "effect" on the source-to-drain current -hence the term "field-effect" transistor.

[^4]Types of FET's. There are basically two types of field-effect transistors in regular use today. The most common is the junction field-effect transistor, or JFET, which has a direct olmmic contact at the gate. The MOSFET, or metal-oxide field-effect transistor (sometimes known as an IGFET for insulated-gate field-effect transistor) has an electrically isolated gate.
In the JFET category, there are p-and n-channel types (see Fig. 2). The n-channel FET is very similar in voltage polarities and biasing to the vacum tube triode as shown in Fig. 3.
The MOSFET, a long-needed semiconductor device, even more closely approximates the input impedance of the typical vactum tube. It can be fabricated to viekl gate impedances well into the several hundred megolm region-beyond the usual capabilities of the common JFET. As shown in Fig. 4, there are currently two types of MOSFET's available. The one on the left is a single-gate type, while the one on the right has two gates.
The MOSFET's sulsstrate is usually connected internally to the source; if mot, the substrate is externally comnected to the source or to ground. Great care must be exercised in handling the MOSFET since the gate input impedince is so high and the gate insulation is so thin that any static charge introduced at the gate can perforate

Fig. 2. Shown here are the schematic
symbols for a p-type (left) and an $n$. type junction field-effect transistor.

POPULAR ELECTRONICS Including Electronics World

Fig. 3. Biasing arrangements for n-type JFET and vacuum tube triode are same.
the oxide insulator barries and destrov the device.

The daal-gate MOSFET finds its most popular application as the mixer stage in AM, FM. and TV tuners where it provides a consenient means of "beating" iwo frequencies in a nonlinear device while mantaming isolation between the two signals. Also the MOSFET appears to exhibit less noise and crossmodulation problems than do comentional transistors and vacuim tubes.

Virtually all MOSFET's produced for large current conditions are contaned in single packages-not integrated circuits. The reason for this is that the FET needs roughly ten times the active area required by bipolar transistors to provide the same corrent capabilities.

It is well to mote that as $r$-f amplifiers. FET's are immue to strong-signal overloads. Some FET's are so symmetrically

Fig. 4. Schematic symbols for single-gate and dual-gate MOSFET's are shown here. constructed that their drain and sonse leads are interchangeable.

The past fell years have witnessed some remarkable developments in the semicomductor scene. It will be interesting to see Which directions research and development will take in the future.

## NEW HOLOGRAM CRYSTALS PERMANENTLY STORE IMAGES

DEVELOPMENT of a crystal capable of storing hologram images as atomic patterns which can be read out one by one, by slow rotation in a laser beam bas been announced by RCA. The development may ultimately lead to a new document storage system in which files of statistics. engineering drawings, computer data, and other graphic material are permanently stored in crystals the size of sugar cubes.

The significunce of the amomucement is that crvstals 500 times more sensitive than ever hefore and a system for permanently "fixing" images stored in them have been developed. Though holograms hase been stored in crystals before a very powerful laser was required and the holograns temled to erase during the readout process.

The RCA holograms can be retrieved relatively easily by the same low-power gas laser used during the storage process. Furthermore, a display from such a hologram can be 15 times brighter than that from a conventional photographic-film negative.

Metallic impurities in the lithimm niobate
and barimm niobate crustals are responsible for the increased sensitivity. Storage capacity is theoretically a trillion bits per cubic centimeter of crystal.

# Till Product 

## HITACHI MODEL IA-1000 INTEGRATED STEREO AMPLIFIER (A Hirsch-Houck Lab Report)

HITACHI, a major Japanese manufacturer of electronic equipment, has entered the consumer hi-fi component market in the United States with a deluxe integrated stereo amplifier, their Model IA-1000. This handsomely styled unit, sporting a brushed aluminum, satin-finish panel with rosewood side trim plates retails for $\$ 319.95$

The IA-1000 has a number of interesting design and construction features. It has a 140-watt IHF music power rating into 8ohm loads. This works out to 55 watts per channel continuous power with one channel driven. Its tone controls are true step-type switches, mulike the mechanically detented potentiometers used in some amplifiers and receivers. The balance control, a potentiometer, also has a slight detent at its center-of-rotation position.

The input function selector has positions for two high-level inputs, a tuner, and two magnetic phono cartridges. Three different input sensitivities on phovo can accommodate almost any magnetic stereo cartridge ever made. The nominal sensitivities of the two phono inputs are 5 mV and 2 mV with 50,000 -ohm impedances, but the latter can be converted to an input for moving-coil cartridges simply by flipping a switch located on the amplifier's rear apron. This increases the sensitivity to a nominal 0.25 mV at 200 ohms inpedance. Most moving-coil cartridges which normally require step-up input transformers with all but a very few amplifiers can be connected directly into this input circuit of the IA1000. A single hybrid integrated circuit, manufactured by Hitachi, is used in each phono preamplifier channel.

The mode switch has positions for hoth normal and reversed stereo and for driving both speaker systems with the $L$ (left), R (right), or both channel signals in the mono mode. A microphone input jack, located on

the front panel with its own level control/ onoff switch, mixes a single microphone signal into both channels, togetlier with any other program source. This microphone signal, however, does not appear at the tape recording outputs.
A number of lever-type switches is used for power on/off, activating either or both of two pairs of speaker systems independently, switching in and out low and high filters and the loudness compensation, reducing the output level by 20 dB (a comenience when answering the telephone or doorbell), and controlling the tape monitoring function. A headphone jack located on the front panel is always energized.

A distinctive feature of the Hitachi IA 1000 is its pair of softly illuminated VU meters which are used to monitor the output signal levels. A switch allows selection of high, medium, or low meter ranges in addition to allowing the meters to be switched out of the circuits altogether.

The rear apron of the amplifier contains all the usual preamplifier/amplifier inputs and outputs, including a DIN-type recorler input/output connector, center-channel output, and preamplifier-out/main-amplifier-in jacks which are nomally connected together electrically. An adjacent slide switch allows the user to break this connection for inserting an equalizer or other accessory into the signal path.

The insulated speaker output connectors are spring-loaded, eliminating the need for a screwdriver when making the hookups. There are three ac outlets, two of which are

Distortion in Hitachi IA-1000 receiver is shown at various power levels and frequencies in the above graphs.
switched. Two fast-acting fuses protect the output transistors in the event an overload situation oceurs, while a slow-blow fuse is used is the ac power line.

Lab Test Results. Our measurements on the Hitachi IA-1000 showed the per-chaunel clipping power output at 1000 Hz with both chamels driven to be 46 watts into 8 ohms, 51 watts into 4 ohms, and 32 watts into 16 ohms. The harmonic distortion, masked by noise at very low power levels, was 0.055 percent at 10 watts, 0.1 percent at 30 watts, and 0.25 percent at 50 watts per channel The IM distortion levels were generally similar.

Using 50 watts per chamel as a reference full-power output, distortion was below 0.6 percent in the midrange, rising to 1.0 percent at 100 Hz and 4000 Hz . Although the distortion curves would have looked better with a lower full-power level, we felt that 50 watts was a realistic choice for the relatively undistorted midrange output. At half power, or 25 watts per channel, distortion was 0.75 percent at 20 Hz , fell to about 0.1 percent at frequencies between 300 and 2000 Hz , and rose gradually to 0.24 percent

We know today's CBer is looking for real value. So we redesigned our Messenger 123 where it counts-on the inside. Our engineers gave the model " $A$ " new improved circuitry. With a new acoustically isolated speaker and voice-tailored audio that cuts noise-increases darity. Plus a new ceramic selectivity filter that rejects adjacent channel chatter. And, of course it has built-in electronic speech compression for famous Johnson "talk power." At \$149.95, the Messenger 123A is a real value. And come to think about it, it's still a great looking CB radio just the way it is.

backed by over 550 authorized service centers nationwide
CIRCLE NO. 19 ON READER SERVICE CARD
at $20,000 \mathrm{~Hz}$. At one-tenth power, the distortion was less than 0.1 percent from 20 Hz to several thousand herte, rising to 0.29 percent at $20,000 \mathrm{~Hz}$.

The tone controls had excellent characteristics, with a sliding inflection point on the bass control which allowed useful correction at frequencies less than 100 Hz with negligible effect on the higher frequencies. The loudness compensation circuit boosted both the low and high frequencies at reduced volume levels. The filters had a desirable $12-$ $d B$ per octave slope, with the $-3-\mathrm{dB}$ points being at 90 Hz on the low end and 4000 Hz on the upper end. The RLAA phono equalization wats accurate to within $\pm 0.5 \mathrm{~dB}$ from 50 H , (0) 1.5 .000 Hz and was down 3 dB at 30 Hz . Measurcments for the RIAA equalization were taken at the lape outputs.

For an output of 10 watts. the required inputs were 68 mV on Aux, 2.2 .5 mV on phono 2. and 0.94 or 0.25 mV on phovo 1 , this last depending on the setting of the moving-magnet/moving-coil cartridge selector sivitch. Phono overloading occurred at 165 mV . 68 mV , and 21 mV for the three phono input sensitivities, providing complete assurance against overdriving the preamplifier from any property installed phono cartridge. The insise level, relative to 10 watts output, was 651067 dB down on the phono
inputs and 71 dB down on the high-level inputs. The microphone input required 1 mV for 10 watts output for a $-56-\mathrm{dB}$ noise level at maximum gain.

We measured the VU meter calibration against power output. basing our results on the use of 8 -ohm loads. The two ineters differed in their radings by 1 to 3 dB at the same pover levels. In the hich range, 0 dB corresponded to 50 watts and -6 dB to 10 watts. The mad range read 0 dB at 10 watts and was doman 7 to 8 dB at I watt. The Low range read about -2 dB at 1 watt and -10 dB to -15 dB at 0.1 watt. Although the calibrations are not accurate enough for any critical level setting purposes, they do provide an interesting insight into the actual power output requited for different listening levels.

The construction of the IA-1000, buth intemally and externally. was excellent. Its finelv finished metal knobs and switch levers operated with a smooth, positive feel. Sound reproduction was excellent, even when driving some rather power-hungry speaker systems. With just about every foature one could expect in a stereo control amplifier, coupled with a very attractive appearance, the Hitachi Model IA-1000 integrated amplifier is a worthy entry into the stereo component market.

Circle No. 65 on Reader Service Card

## HEATHKIT SOLID-STATE TRIGGERED-SWEEP OSCILLOSCOPES MODEL 10.103 SINGLE-TRACE AND MODEL $10-105$ DUAL-TRACE

1N THE recent past, such niceties as wide bandwidth, fast rise time, and triggered sweep could be found only in multi-thou-sand-dollar oscilloscopes designed for R\&D laboratories. Now, however, there are two low-priced scope offerings featuring these and many other chatacteristics. They are both made by Heath and are designated as the Model io-105 (dual-trace) and the Model IO-10:3 (single-trace). Respectively, they are listed in the catalog at $\$ 429.95$ and $\$ 229.95$. For these prices, you get scopes that are just as at home in general-purpose use as thev are on the lab bench.
Leading off with the $10-105$, we can state that this is the scope hit to end all scope kits. With respect to functions and technical specifications, this scope is comparable in performance to many of the high-er-priced commercial units presently being used in R\&D labs. Yet, its low cost puts it within the reach of the serious experimenter and service technician,

The 1O-105 features two broadband channel inputs, each having a frequency response
from de to 15 MHz , rise time of 24 ns , nineposition attenuator in a $1-2-5$ sequence providing a range of from $0.05 \mathrm{~V} / \mathrm{cm}$ to 20 $\mathrm{V} / \mathrm{cm}, \mathrm{ac} / \mathrm{dc}$ coupling, and the choice of either chamel 1 or chamnel 2 or both in alternate and chop modes. Each channel is fully independent of the other, with its own gain, ac/dc input switch, and trace positioning control.

The time base, which is common to both imput channels, is a true triggered sweep system which has 18 calibrated rates from $0.2 \mu \mathrm{~s} \quad 10100 \mathrm{~ms} /$ division in a $1-2-5$ sequence with a continuously variable rate which can be switched in as desired. Sweep triggering can be accomplished from either channel, and the user can select the "auto" mode in which the sweep is triggered at the average do voltage of the input signal or the "normal" mode vhere a front-panel trigger level control permits starting the trace at almost any point desired. A conventional stability control permits "fine tuning" of the triggered sweep.

Additionally, there are an X-Y mode in which the two inputs are coupled in a vectorscope fashion with chansel $l$ on the vertical axis and chamel 2 on the horizontal axis, and a TTL-compatible blanking input and gate output, this last lecated on the rear apron.

The $10-103$ general-purpose scope is only slightly less sophisticated than the IO-105. A single-trace, triggered-sweep affair, its frequency response extends from de to 10 MHz at 3 cm deflection (dc-8 MHz at 6 cm deflection). Sensitivity is specified at 50 mV , while rise time is 50 ns . Like the IO105, the 10-103's attenuator has wine positions in the 1-2-5 sequence; it yields a range of from $0.05 \mathrm{~V} / \mathrm{cm}$ to $20 \mathrm{~V} / \mathrm{cm}$. The time base sweep is a seven-position switching arrangement which covers a range of from $100 \mathrm{~ns} / \mathrm{cm}$ to $100 \mathrm{~ms} / \mathrm{cm}$. At one of the front panel jachs, there is available a 1 -volt peak-to-peak, fio-Hz relerence/test signal which is used for calibrating the IO-103's vertical deflection circuits and, later, for whatever you have in mind.

Similar Yet Different. There are some basic similarities between the IO-105 and 10-10.3 scopes. First, of course, is that they are both all solid-state (except the CRT). Each has a variable-intensity/off calibrated graticule over the flat screen of the CRT, held in place by a rectangular camera-mount bezel. Aside from the usual complement of

scope controls, each model has a series of switches which are used to select internal or external sonre triggering, ac or dc coupling arrangenent. + or - triggering slope, and nomal or automatic triggering.

Both the IO-10.5 and 10-10.3 have display expansion; in the $10-105$ the magnification factor is X 5 . while in the $1 \mathrm{O}-103$, it is X 2 . This welcome feature allows the user to examine critically any waveform displayed. In the IO-105, the magnifier function is on an independent switch, while in the IO-103 it is an attachment on the horizontal positioning control and is activated by pulling out the control knob. In both cases, the magnifier is defeatable.

The imput connectors on both scopes are BNC female types. The coaxial input cables have mating male-type BNC connectors on one end and alligator clips on the other end. (Heath also makes available their Model PKW-101 high-frequency compensated probe for use with both scopes at $\$ 23.95$. It comes completely assembled and has a bandwith of de to 30 MHz .)

The differences between the two scopes are mostly subtle. Aside from the obvious differences in frequency response, rise time, magnifier figure, and input chamel capabilities, the two are different mainly in cosmetics. For example, while the two are almost the same size-the IO-105 measures $15^{\prime \prime} \times 129^{\prime \prime} \times 10^{\circ \prime \prime}{ }^{\prime \prime}$ and the IO-103, 16夝" $\times 12_{a^{\prime \prime}}^{3 \prime} \times 99^{\prime \prime}$-the dual-tracer is a blocklike affair with projections only on the front panel, while the single-tracer has a raised ridge along the top, topped off by the carry-
ing handle and a rear-projecting plastic cup over the neck of the CRT, in addition to the front panel projections. (On the IO105 , the handle is recessed into the case top.)
The graticule on the IO-103 has a $6 \times$ $10-\mathrm{cm}$ grid, while the $10-105$ has an $8 \times$ $10-\mathrm{cm}$ grid. For reasons which will become obvious, the control grouping on both scopes is different, but in neither case are the controls difficult to find or awkward to use.
The IO-10.5 is designed along the traditional lines of the laboratory scope. Hence, it is really a two-part system, consisting of a basic main frame containing the CRT, associated "ontrols, and power supply, and a "plug-in" imput module containing the separate clannel preamps and processors. Interconnections between the two assemblies are made via appropriate comnectors. (Incidentally, with this plug-in arrangement, we assume that the Heath people have other input modules in mind for use with the main frame section. It would not be difficult to replace the dual-trace module with, say, a curve tracer, spectrum analyzer, etc.)

Assembly and Calibration. It is difficult to believe that, after building either of these oscilloscopes, they are such highly sophisticated test instruments. The IO-105 aud IO-

103 kits are actually easy to assemble, even if the builder has only limited experience in assembling kits. This is clue in large part to the fact that ahmost all components mount on printed circuit boards which are interconnected with factory-prepared wiring hamesses, and to the excellently written and illustrated assembly manual.
The 10-105, due to its higher order of sophistication and complexity, took the longer of the two kits to assemble. Using carefill assembly techmiques, total building tine was 27 hours. The IO-103 took just under 18 hours. The initial checkout and calibration, requiring the aid of only a VTVM or TVM, ate up another 30 minutes for the 10 103 and about 45 minutes for the IO-105.
Once we had our scopes in operating order, we could not resist the temptation to compare the manufacturer's published specifications with actual performance tests. To do this, we used laboratory-standard equipment of known accuracy. We can now categorically state that both scopes performed welh within their published specifications. In fact, in most of the vital areas, the published specifications were very conservative, which is not really surprising in light of the fact that the Heath people traditionally publish conservative ratings.

## dYnascan cobra 130 Cb transceiver

THE Dynascan Cobral 1.30 is a syntliesized 23-channel CB transceiver designed for use on conventional AM or on SSB (upper or lower sideband). It is a solid-state unit designed primarily for mobile use with power derived from a 12 -volt negativeground de source.
The operating features of the Cobra 130 are those which are now becoming more or less standard with this type of transceiver. They include $r$-f and a-f gain controls; a selector switch with positions for AM, $\mathrm{SSB} / \mathrm{USB}$, and $\mathrm{SSB} / \mathrm{LSB}$; adjustable squelch; voice-lock (fine tune); AM noise limiter and SSB noise blanker; built-in
speaker; jack for external speaker with receiver for PA operation; detachable microphone, and a transmitter-on/modulation indicator lamp.

Technical Notes. No schematic diagram was supplied with our test unit, but we were otherwise able to determine the following: The 130 employs three FET's, 32 bipolar transistors, an integrated circuit, and 62 diodes. Double conversion is used on receive for AM with 7.3 MHz and 455 kHz for the first and second $i$ if's, respectively. Ceramic filters provide the required selectivity at the second $\mathrm{i}-\mathrm{f}$, whereby a 6 -dB band-pass of 5 kHz is obtained with a rated adjacentchannel rejection of 50 dB . In our test unit, however, the selectivity response was found to be somewhat unsymmetrical, resulting in an adjacent-channel rejection of 20 dB on the low-frequency side and 80 dB on the upper side.
A separate i-f section at 7.8 MHz is engaged
for single conversion on SSB with selectivity and sideband selection oltained with a 2.1 kHz bandpass crystal filter. Since this filter provides all the selectivity required (with the unwanted-sideband rejection measured as 60 dB at 1 kHz ), there is no meed to go to a second conversion at a lower i-f.

A product detector is engaged for SSB , an envelope detector for ANI. DSB, sup-pressed-carrier signals cam also be copied in the SSB mode. Adjustable squelch operation is provided for each mode of operation with a threshold sensitivity down to less than $0.5 \mu \mathrm{~V}$.

The same "front end" (r-f imput amplifier and mixer) is employed for both modes of reception with the separate comversion sections and detectors switched in individually for SSB or A.M. The setup provides a measured sensilivity of $0.15 \mu \mathrm{~V}$ on SSB and $0.5 \mu \mathrm{~V}$ on AM for a $10-\mathrm{dB}(\mathrm{S}+\mathrm{N}) / \mathrm{N}$. The circuitry, plus the following i-f, provided an image rejection of 80 dB .

Individual series-gate type noise blankers can be switched into the system independently for SSB or AM to ensure optimum performance in each case. Anyone who has handled gear with a good noise blanker,
such as the ones used in the 130, will appreciate how much more effective this method of noise silencing is over the usual type of noise limiter.

Combinations of frequencies obtained from a crystal-controlled frequency synthesizer provide the hetercdvaing signals at the mixers as needed for the particular conversion. A "voice-lock" control at one group of crystals is designed to permit the receiver frequency to be varied 600 Hz either side of the center frequency, enabling the receiver to be tuned exactly to the received signal for proper demodu ation on SSB .

Transmitter Section. The initial carrier for the transmitter is produced at 7.8 MHz with the frequency synthesizer signals used for conversion to the chamel frequency. SSB signals are generated with the initial carrier using a balanced modnlator and a crystal-lattice filter. Different groups of crystals are engaged at the synthesizer for either lower- or upper-sideband operation on the various channels. The SSB signals are brought up to a 15 -watt PEP input at the $r$-f power-output amplifier with a measured PEP output of 8 watts into 50 ohms with

Prices are suggested retail
operation from a 13.6 -volt de source (normal battery potential when a vehicle's engine is running). With a 12 -volt source, it drops to 6 watts output.

The unwanted-sideband suppression at 1 kHz was found to be 50 dB and the carrier suppression, 60 dB . The second- and fifth-order distortion products were 25 and 40 dB down, respectively; better than the manufacturer's rating of $20-25 \mathrm{~dB}$ and than that usually found with solid-state CB transceivers,
There is an automatic level control (alc) system designed in to maintain relatively uniform modulating levels and prevent power amplifier overdrive; however, flattopping of the SSB signal (which increases the distortion prodacts) can still occur at high speech levels.

The voice-lock control at the synthesizer also varies the transinitter frequency, automatically placing the transmitter on exactly the same frequency as that of a received SSB signal properly tumed in. For our moncy, this is the preferred arrangement as opposed to others where onlv the receiver section's frequency can be shifted.

The synthesizer crystals are held to a closer tolerance than isual in order that the maximum possible deviation with the voicelock will maintain the transmitter frequency within the legal tolerance. With our test unit, the maximum possible deviation from the exact frequence on any chamel was -900 to +1350 Hz , thus holding to within the required 0.005 percent limit.

AM Operation. For AM, the SSB-producing section of the transmitter is disabled and the r-f driver and PA are modulated by
the receiver a-f power-output amplifier. The AM input runs up to 5 watts with a measured carrier output of 3.75 watts using a 13.6 -volt de power source. Cood modulation up to 100 percent was attainable with clipping at this point for a hefty-sounding signal.

When the AM carrier is on, a red lamp comes on and blinks brighter when modulation is applied. With SSB, because of the suppressed carrier, the lamp does not come on until modulation is applied, at which time it lights to a brilliance determined by the modulation peaks.

When a loudspeaker is plugged into the extemal speaker jack, it cuts off the builtin speaker and permits the signal to be heard only on the external speaker. A PA/CB switch on the front panel cuts off the receiver output and sets up the transceiver for PA service using an extemal speaker at another jack. We measured the a-f output as a good 3.5 watts into 8 ohms.

Performance. The preceding discussion contains much data on what to expect from the Cobra 130 in the wav of performance. In addition, the age holds the a-f output to within 10 dB and 2 dB with an r-f input change of $20 \mathrm{~dB}(1-10 \mathrm{MV})$ and 60 dB $(10-10,000 \mu \mathrm{~V})$, respectively. On the other hand, there is sometimes not sufficient control to prevent overload with distortion on strong local SSB signals. However, this can be alleviated by turning down the r-f gain control.

The Cobra 130 is a good-looking, easy-touse and operate transceiver made in Japan. It measures $11^{3 / 3^{\prime \prime}} \times 9^{\prime \prime} \times 2 / 2^{\prime \prime}$ and weighs $6 \frac{1}{2}$ pounds. It is list-priced at $\$ 349.95$

Circle No. 67 on Reader Service Card

## BIRD "HAM-MATE" MODEL 4350 R-F WATTMETER (A Hirsch-Houck Lab Report)

THE widely used Bird "Thruline" r-f directional wattineters employ plug-in sensing elements for different power and frequency ranges. The elements rotate in their sockets to read forward or reflected power in a conaxial transmission line. Elements are avalable for full power ranges from 1 watt to 10,000 watts, covering frequencies from 450 kHz to 2200 MHz .

The relatively high price-typically $\$ 150$ or more-of the commercial Bird Thruline r-f wattmeters has limited their use in annateur radio stations. Now, however, the

Bird "Ham-Mate" Series 4350 r-f directional wattmeters have brought the basic perfomance of the commercial instruments to the amateur radio market in terms of cost.

The Bird 4350 is a compact, self-contained unit, measuring $5^{3 / \prime \prime} \times 4^{\prime \prime} \times 3^{3_{8}^{\prime \prime \prime}}$. It weighs $1 \frac{18}{4}$ pounds. The meter face is slanted for easy viewing. On each side of the case, there is a female SO-239 uhf connector, one of which goes to the transmitter while the other goes to the antenna or dummy load rated at between 50 and 52 ohms. The meter can be left permanently con-

nected in the transmission line since it has no effect on the transmission systen's performance.

The Model 4350 contains a $4^{\prime \prime}$ section of rigid air-dielectric coaxial line coupler which is designed for an accurate 50 -ohm impedance. The rotating sensing element is inserted into the side of the coupler and is
capacitively coupled to the inner conductor of the rigid coax.

The Ham-Mate has two power ranges ( 200 watts and 2000 watts) which can be alternately selected according to the posi timning of the slider on a higil-Low sivitch. The sensing element is not removable, but is turned by a kinoh to read forward or reflected power. The rated frequency range is from 1.8 . Mhz to 30 MHz . A similar unit to the Model 4350), the Model 4351, has a 1000 -watt min range instead of 2000 watts, and another, the Model 4352, has ranges of 40 watts and 400 watts and a frequency range of 50 MHz to 150 Mllz . All models carry the same $\$ 79$ price tag. And all have a published rated accuracy of $\pm 8$ percent fullscale.

Comparison Tests. Lacking an accurate $r$-f standard wattmeter, we were unable to verify the accuracy of the Bird 4350 HamMate in a rigorous manner. However, we did make substitution measurement comparisons between it and another popular r-f wattmeter designed for the amateur market, using a Heath "Cantema" 50-ohm dummy load and several antenna systems. The signal source was a Heath Model SB-400 exciter

## SAVE MONEY!

## A Delta Mark Ten Capacitive Discharge Ignition (CDI) System On Your Car Slashes Maintenance Costs And Increases Performance.

Put a Mark Ten on your car and save by eliminating 3 out of 4 tune-ups. Save as gasoline mileage increases (up to $20 \%$ ). The Mark Ten CDI system also extends spark plug life, promotes more complete combustion and assures instant starts in all weather. It operates on any 6 or 12 volt negative or positive ground system.

The Mark Ten B affords additional money saving advantages by drastically reducing combustion contaminants and restoring power lost by the use of smog control devices. Equipped with handy switch for instant return to standard ignition, the Mark Ten B works with ANY 12 volt negative ground engine. Both systems install in ten minutes without rewiring.

Order your Mark Ten or Mark Ten B today. Save money while you enjoy low maintenace and increased performance.

and, when necessary, a Heath Model SB-200 linear amplifier.

On the $14-\mathrm{MHz}$ amateur band, where Bird suggests calibrating their Model 4350 , the two meters agreed very closely at power levels from 10 watts to 200 watts. The total "spread" between the two mits never exceeded 10 percent of their average readings and was usually much less. On the high power ranges, the differences were greater, typically 15-20 percent. Since the accuracy rating of the Bird 4350 is $\pm 8$ percent of fullscale, which would permit an error of 160 watts at any point on the rich range, no firm conclusions can be drawn as to the accuracy of either unit. On the other hand, if either was considered to be the reference standard, the other was also within its published accuracy specification. In all cases, the reflected power reading was zero, as would be expected with the 50 -ohm dummy load used.
To check the Ham-Mate under the less-than-ideal conditions of an antenna load with an appreciable standing wave ratio (SWR), we again compared the two units on the $10-, 20-, 40$, and 80 -meter amateur bands. On 10 meters, the Bird and comparison units indicated, respectively, 75 watts and 78 watts with both showing 1 watt of reflected power. On 20 meters, both
inclicated 120 watts forward and 12 watts reflected power. On 40 meters, with a badly mismatched antema, the Bird indicated 190 watts forward and 100 watts reflected power, while the comparison unit indicated 200 watts forward and 110 watts reflected power. The net radiated power ( 90 watts) was identical as measured with both instruments. The corresponding SWR's, calculated from the power readings, were 6.4 with the Bird and 6.8 with the comparison unit-certainly close enough for any practical purpose. On 80 meters, both imits indicated 120 watts forward, while the reflected powers were 8 watts for the Bird and 6 watts for the comparison unit. Since the latter readings were near the bottoms of the moter scales, no significance can be attached to the small discrepancy

Even though our tests could hardly be considered a proof or disproof of any of the Bird specifications, we have not the slightest doubt that the 4350 does exactly what is claimed for it, probably with an error much smaller than its ratings would allow. At about half the price of the commercial Thruline $r$-f directional wattmeters, the Model 43.50 does practically the same job, with very nearly the same accuracy, over the range of poiver levels and frequencies encountered in h-f ham communication.

## EICO SS-500 SECURITY ALARM SYSTEM

I$T$ MAY take many hours of searching through various catalogs to piece together a security system to suit your particular needs. After looking at the various sensors, hells, buzzers, and switches, you may start to wonder just how such a system can be integrated and how it will work. What with ac and do bells, normally open and normally closed switches, fire and smoke sensors, and the multitude of window and door sensors available in various configurations, putting together a system can become, at best, a difficult task.

Now, for the do-it-yourselfer, Eico has come out with their Model SS-500 security alarm system retailing for $\$ 99.95$. This system includes the company's assembled Model FC-100 security control center containing all the electronics for monitoring the intrusion or fire warning system and the Model A-75 ac power supply in a compact wall-mounted security box. The Model SD10 door-svindow magnetic contact reed
switches supplied are two-piece units consisting of a normally open reed switch encased in a plastic housing. A bar magnet for controlling the open/close conditions of the switch is encapsulated in a similar plastic housing.

As long as the magnet is kept close to the reed switch, the switch contacts are held closed magnetically. When the magnet is moved far enough awav from the reed switch so that its magnetic field is weakened considerably, the contacts spring open. The distance by which the magnet needs to be removed from the reed switch to cause the contacts to open is very small to insure proper security.

When the contacts of the reed switch open, the FC-100 security control center senses the interruption and the alarm system activates.
The SD-20 fire sensors included in the system are designed for a normally open circuit condition. When heated to their

Photo shows various items which can be integrated into Eico's security system.
operating temperature ( $135^{\circ} \mathrm{F}$ or the optional $190^{\circ} \mathrm{F}$ level) they automatically close, arming the inclependent fire-warning system and someding the associated Khanon horn.

The SD-40 (loor cords supplied with the SS-500 system are 12 "-long flexible leads used to connect a movable door or window to its contacts on the adjoining jamb. SD50 tamper switches are provided for mounting on the control center or the external bell housing to somed the alarm automatically if either of these units is moved from its preset mountings.

Two control stations (Model A-65 remote and Model A-45 entrance) have lamps to indicate the state of the system and provide means of entering the protected areas using the special key provided. A-45 emergency buttons, sometimes called "panic buttons," allow operation of the alam from any location within the house and override the other sensors. Besides these and other sensors, $250^{\prime}$ of hookup wire is also supplied.

Available separately for $\$ 2.95$ is the A-95 "Home Secority Handbook" which illustrates the various methods which can bo used to protect a house or other premises. If you are considering putting in your own alarm system, take a look at this informative manual.

There are also available a number of optional accessories to the basic secmity system. These include additional remote stations, Klaxon horns, high-temperature
$\left(190^{\circ} \mathrm{F}\right)$ heat sensors, freeze-up and water flood sensors, and window tape. All of these can be seen on your bocal Eico deaters display rack. If you do not want to purchase a complete SS-500, you can pick and choose from among the components displayed according to your needs.

Installing the System. We found that installing the security system is easy, and the only tools we needed were a screwdriver and a knife. We picked an arrange ment from the manual. suitable to our needs, and went to work. In a matter of hours, the job was completed. Using the instructions supplied with the SS-500, the system was tested and found to operate properly as each protected door and window was opened. The alarm bell's clanging was reassuring. The fire alert system was tested using kitchen matches. It, too, operated with reassuring promptness. We had no real need for the "panic buttons," but ve could well see how such a button placed at bedside could offer the bedridden, elderly, or infirm some consolation when they are home alone.

The intrusion and fire alerts are two completely independent systems. When the intrusion alarm is disabled-as it usually is when the family is at home-the protection of the fire alarm system remains in readiness at all times.

The Model FC-100 control center is avail able separately. Alone, it retails for $\$ 49.95$

[^5]

## XCELITE COMPACT DRIVER SETS

fust added to their tool line of "compact convertibles" are three new all-purpose Ycelire screwdriver/nutelriver sets. Each consists of an assortment of color-coded midget tools and a mique "pigguback" torque amplificr handle The PS-6 screwdriver sel includes miniature drivers for No. Oo. O, and 1 Phillips: 3/32" $1 / 8^{\prime \prime}$, and $5 / 32^{\prime \prime}$ sloted screws. The P'S-140 screwdriver and mutdriver set contains a popular assomment of drivers for No. 1. I. athe 2 Phillips screws: $3 / 32^{\prime \prime}, 1,8^{\prime \prime} .3 / 16^{\prime \prime \prime}$ and $11^{\prime \prime} 4^{\prime \prime}$ slot ted screws: and $1 / 4^{\prime \prime} .5 / 16^{\prime \prime}$. and $38^{\prime \prime}$ hex muts. Finally, the PS-1:30 serewdriver and mutdriver set is similar to the PS-140 with a larger assortment of mutdrivers, including $3 / 16^{\prime \prime}$. $1 / 4^{\prime \prime}$. $5 / 16^{\prime \prime}, 11 / 32^{\prime \prime}$, and $38^{\prime \prime}$ hee sizes, plus drivers for No. 1 and Xo. 2 Phillips screws and $1 / 8^{\prime \prime}$ $3 / 16^{\prime \prime}$, and $1 / 4^{\prime \prime}$ slotted screws.

## Your key to a brighter future in electronics:

## the exclusive Bell \& Howell Schools Electro Lab ${ }^{\circledR}$. It's a complete electronics laboratory-in-the-home you build and keep as you prepare for a new career or color TV servicing business of your own!

For free information about how you can build and keep the Electro Lab - and a 25 -inch color TV-detach and mail postage-free card opposite.
Here's your chance to get into one of the fastest-growing fields in industry today electronics. Your key to a brighter future is career-oriented training. Find out now how you can get that training from Bell \& Howeil Schools using the exclusive Electro Lab ${ }^{-}$electronics laboratory-in-the-home!

Exclusive Electro Lab gives you practical experience at home - two ways! First, you
build your home electronics laboratory yourself - with sixteen shipments of top-quality electronic components. As you assemble your lab. you learn electronics theory ... build new
manual skills ... learn how each instrument works so you can maintain and repair it yourself

Second. you actually yse your Electro Lab* as the "tools of your trade" while you build your Bell \& Howell solid-state 25 -inch color TV. You gain experience using these instruments as they're used daily by professional technicians. And you'll continue
to use them throughout your career
No need to give up your present paycheck! With your Bell \& Howell Schools Electro Lab ${ }^{\star}$, you can prepare for growing opportunities in electronics right in your own home. You don't have to leave your present job or travel miles to classes. Everything comes to you by mail. You build your own lab... use it to help you assemble a 25 -inch color TV...then start a new career or business of your own in color TV servicing.

## Here's what you build and keep:

Design Console Use this to rapidly "breadboard" circuits and perform over 300 electronics experiments. No wiring or soldering You simply plug and unplug modular units to create different circuit designs. The fast, easy up-to-the-minute way to master basic electronics.

Oscilloscope This is standard equipment for professionals in electronics. Once you've built it, you'll use it throughout your career. Helps you assemble, wire test and check electronic equipment Offers bright, sharp screen mages calibrated for peak-1opeak voltage and time measurements.
YOU ALSO BUILD AND KEEP A BELL \& HOWELL SOLID-STATE $25-\operatorname{INCH}$ COLOR TV

FOR FREE INFORMATION, MAIL POSTAGE-FREE CARD OPPOSITE

Transistorized Meter After you've assembled this sensitive instrument. you'll use it to measure current, voltage and resistance. Registers measurements on a large, easily-read dial Combines mast desired features of a vacuum-tube voltmeter and a quality muitimeter. It's portable, too!

## ABC'S OF ELECTRONIC POWER

by Rufus P. Turner
The text in this book clearly explains inst what electronic power is and how it is measured. The first chapter deals with fundamental ideas of power in resistive and reactive circuits. De power, being much simpler than ac power, is allotted one chapter. Ac power, having the added considerations of power factor, single phase and polyphase, and audio and radio frequency measurements, is given three chapters for discussion.
Published by Howarl W. Sams \& Co. Inc. 4301 West 62 St., Indianapolis; IV 16268. Soft cover. 96 pages. $\$ 3.50$.

## THE RADIO AMATEUR'S HANDBOOK, 49th Edition

This latest edition of the amateur raclio operator's "bible" contains the most extensive revision and update ever attempted. Thirteen chapters have been rewritten to cover new devices and techniques, and the material has been completely reorganized to make individual material easier to find. Among the new sections are discussions of digital logic devices, linear IC's, hf and whe antemas, broatband amplifiers, filter networks, converter designs, ancl SSB techniçues. A new 28 -page chapter on frequency modulation and repeaters is also included, and 200 new drawings and charts have been nsed to present the current state of the art in all areas of anatern commencations.
Published by Ancrican Radio Relay League, luc., Newington, CT 06111. Soft cover. 704 pages. \$1.50.

## UNDERSTANDING RADIO ELECTRONICS Fourth Edition

> by Milton Koufman et al In this extensively revised edition of a popular book, uplated to inchude solid-state concepts, the authors provile complete coverage of the communication electronics field. The book itself is designed for cither self-study or classroom use and is specifically written for vocationally oriented high school or commonity college students with little or no previons training in electricity or electronics. Included are 300 new illustrations and self tests to help students re-

view important material and increase their comprehension.
Published by McGraw-Hill Book Co., 3:30 West 42 St., New York, $N$ ) 100.36. Hard cover. 732 pages. \$10.95

## SHORTWAVE LISTENER'S HANDBOOK <br> by Normon Fallon

This book ofters the beginning listener a complete introduction to shortwave equipment and techniques and many valuable tips for even the experienced SIVL. Topics covered include descriptions of the full range of SWVL equipment, evaluation of all types of receivers and antennas, tuning and logging stations, coping with listening conditions, hunting weak signals, and getting reception reports, station schedules, and other useful data. The world's major SW broadcast stations are listed by country and frequency. There is a glossary of SWL terms and a unique selection of 10 do-it-yourself projects complete with parts lists and diagrams. Published by Haylen Book Co., Inc., 115 West 14 St.. Veic York, V) 10011 . Soft cover. 144 pages. \$3.95.

## COMMERCIAL RADIO OPERATOR THEORY COURSE

by Martin Schwartz

## A complete course in radio theory, this book

is written in a simple style, supported by mumerous diagrams, that requires no technical background. It legins with the basic concepts of electricity, and proceeds to transmission and reception. At the end of each lesson, an exam, hased on questions presented in exactly the same manner as they are on the FCC exams, tests the reader's comprehension of the material covered. Tivo final exams-one for the l"irst and and another for the Second Class license-are also provided.
Published by Ameco Publishing Corp., 314 llillside Ace., Williston Park, NY 11596. Soft cocer. 448 pages. $\$ 5.95$.

## SOLID STATE ELECTRONIC DEVICES

by Ben G. Streetman

Electrical engineers and scientists, as well as newcomers to electronics, constantly need updated understanding of electronic devices. This book provides the background for this type of continuing study. Beginning with second-year college physics, the text develops technigues for keeping up to date on future electronic devices and applications. The reader becomes better ednipped to gather new data from current periodicals and professional literature in the electronics field.
Published by Prentice-Hall, Inc., Englewood Clifs. NI (\%632. Hard cover. 463 pages. $\$ 13.95$.

## aVANTI antenna catalog

Avauti's new Citizens Band Communications Citalog features the company's complete line of base station, mobile, and marine antennas, trunk lid and deck mounts, and co-phasing harness kit and accessories. The catalog is in full color, and each entry is fully described both electrically and mechanically. Address: Avanti Research \& Development, Inc., $33-37 \mathrm{~W}$ W. Fullerton Ave., Addison, IL 60101.

## STANCOR CROSS REFERENCE GUIDE

The new 64-page Stancor Color and Monochrome Television Parts Replacement Guide is now available from Essex Controls Div. It lists more than 500 Stancor transformer and deflection components for 200 TV receiver brands, providing the technician with replacement data for more than 14,000 original parts. A separate section covers the Stancor line of Hylacks, deflection yokes, vertical outputs, filter chokes, power, and output transformers. Address: Essex Int I., Inc., Controls Div., Stancor Products, 3501 W . Addison St., Chicago, IL
60618.

## MOTOROLA HEP CROSS-REFERENGE GUIDE

Approximately 38,000 semiconductor devices are cross-referenced to HEP replacements in the new 1972 Motorola HEP Semiconductor Cross-Reference Guide \& Catalog. Included in the listings are $1 \mathrm{~N}, 2 \mathrm{~N}, 3 \mathrm{~N}, \mathrm{JEDEC}$, mamufac-
turers' regular and special "house" numbers, and many international devices. Some 467 HEP items are listed, including hardware, accessories, technical manuals, and holby project books. The catalog is free at local HEP clealers, or write to: Motorola Inc., Semiconductor Products Div., 5005 E. McDowell Rd., Phoenix, AZ 85036.

## ATLAS SOUND MIKE STAND brochure

A four-page brochure exclusively devoted to its line of microphone stands, stand accessories, adaptors, and fittings has just been released by Allas Sound. It outlines the functional and mechanical details for 14 commercial and professional floor stand models, 12 desk stands, four boom stands, and more than 50 stand accessories. For a copy of Form -201, write to: Sales Dept., Atlas Sound, 10 Pomeroy Rd., Parsippany, NJ 08054.

## IRC CROSS REFERENCE AND DATA BOOK

The $\mathrm{S}_{\mathrm{p}}$ ring Edition of International Rectifier's "Semiconductor Cross Reference and Transistor Data Book" contains more than 35,000 listings, including 10,000 not previously shown, making it one of the most comprehensive crossreference books in the industry. Listings include transistors, diodes, zener diodes, capacitors, rectifiers, and SCR's. Copies of the 64 -page book, No. JD-45l, can be obtained from authorized IRC dealers or by writing to: Semiconductor Div., International Rectifier Corp., $2: 33$ Kansas St., El Segundo, CA 90245.

## metrologic laser catalog

A new illustrated catalog available from Metrologic Instruments, Inc., lists and describes seven laser models, including a new modulated type, and a wide range of accessories to extend their use for education and research. In addition to six ready-to-use models, the catalog describes low-cost educational kits which capitalize on laser light to teach optics and light theory. Other listings include holographic equipment, laser kits, accessories, and optics bench equipment. Address: Metrologic Instruments, Inc., 143 Harding Ave., Bellmatvr, NJ 080:30.

## YOUR ELECTRONICS SUPERMARKET

# 工 Surplus Scene 

By Alexander W. Burawa, Associate Editor

## IN THE BATTLE FOR FIRST PLACE, THE BUYER WINS

AS ELECTRONICS hobbvists, we are acAcustomed to thinking in terms of numbers. We measure parameters which have mamerical guantities and design circuits and networks which require manipulations with numbers. But perhaps the most important numbers we deal with are the dollar and cents figures which ultimately control the degree of our involvement in the electronics hobby. To put our designs into practice requires spending our hard-earned cash for parts and equipment. Obviously, the less we spend for a given project, the more projects we can build. It is fortunate that military, government and commercial obsolescence as well as production overruns have created a Surplus Scene which can salve us a great deal of money ou parts expenditures.

Keeping abreast of which company happens to hold the number one spot with the lowest price for any given electronic device at any given moment is no easy task. The market is currently so competitive that the dealer with the lowest prices this week may well have the second or even third lowest prices next week. With what appears to be a price "war" on, the buver-you and I-are the big wimers. In the past few months alone, there has leen a marked reduction in both unit and quantity cost of various items ranging from transistors, MSI and LSI integrated circuits, and all types of numeric readout indicators to the basic items like resistors, capacitors, switches, relays, transformers, and controls. In some respects, the price reductions have reversed the late inflationary trends of the economy-today, vour dollar buys more than it did this time last vear, but only if you are a smart shopper.

Some of the most stimulated competition has been in all types of solid-state devices. Among the top contenclers for the "mostest
for the leastest" are such companies as Solid-State-Sustems, Inc. (Box 7i3, Columbia. MO 65201), B. d-F. Enterprises (Box 44, Hathorne, MA 01937), and Poly-Paks (Box 942 E , Lynufield, MA (01940). All three companies are strong on diodes and transistors but excel in their diversity of IC's especially the 7400 series of digital TTL integrated circuits and their compatible readout indicators.

On the balance sheet, Jolm Meshma, Jr. (19) Allerton St., Lyın, MA 01904) and Delta Electronics Co. (P.O. Box 1, Lynn, MA 01903) are also close contenders for the low-price top spot in the semiconductor area. Their offerings are just a bit less diverse in the very popular digital IC line.

For switches, resistors, potentiometers, capacitors, relavs, tranformers, and the like, Meshna, Delta, and Poly-Paks seem to share the laurels with the widest assortment of offerings

For test equipment and communication gear, we shouldn't pass up Fair Radio Sales Co. (P.O. Box 1105 , Lima, OH 45802), Surplus Center (P.O. Box 82209 , Lincoln, NB 68501) R. E. Coodhearl C?., Inc., (Box 1220, Beverly Hills, CA 90213), and Baynton Electronics Corp. (2704 North Broad St., Philadelphia, PA 19132). Incidentally, Baynton stocks perlaps the widest selection of professional commercial test equipment available anywhere.

Now that the trend toward lower parts and equipment prices has been set, can we expect the market to improve even more? The answer is a qualified "Yes." While it is quite possible that the day is not long into the future when you will be able to buy IC's by the dozen. diodes by the hundred, etc., for only a dollar or so, the real improvement will come in the form of state-of-the-art items filtering down to the consumer parts markets.

E, 409 Railroad Ave., Westbury, N.Y. 11590

MONEY BACK GUARANTEE.

YOUR Classified or Display Classified Ad in these columns will be seen, read and regularly responded to by America's largest audience comprising Electronics Professionals and Hobbyists. Cost is low, results high (most advertisers repeat 12 times each year). Send copy and payment now to address indicated at beginning of ELECTRONICS MARKET PLACE.

## ABOUT YOUR SUBSCRIPTION

Your subscription to Popular Electronics is maintained on one of the world's most modern, efficient computer systems, and if you're like 99\% of our subscribers, you'll never have any reason to complain about your subscription service.

We have found that when complaints do arise, the majority of them occur because people have written their names or addresses differently at different times. For example, if your subscription were listed under 'William Jones, Cedar Lane, Middletown, Arizona," and you were to renew it as "Bill Jones, Cedar Lane, Middletown, Arizona," our computer would think that two separate subscriptions were involved, and it would start sending you two copies of Popular Electronics each month. Other examples of combinations of names that would confuse the computer would include: John Henry Smith and Henry Smith; and Mrs. Joseph Jones and Mary Jones. Minor differences in addresses can also lead to difficulties. For example, to the computer, 100 Second St. is not the same as 100 2nd St.

So, please, when you write us about your subscription, be sure to enclose the mailing label from the cover of the magazine-or else copy your name and address exactly as they appear on the mailing label. This will greatly reduce any chance of error, and we will be able to service your request much more quickly.

# READER SERVICE wromintion 

Here's an easy and convenient way for you to get additional information about products advertised or mentioned editorially (if it has a reader service number) in this issue. Just follow the directions below . . . and the material will be sent to you promptly and free of charge.

1. 

On the attached postage-free card, print or type your name and address on the lines indicated.

Circle the number(s) that corresponds to the key number(s) at the bottom or next to the advertisement or editorial mention that is of interest to you.
(Key numbers for advertised products also appear in the Advertisers' Index.)
3. Simply cut out the card and mail.

No postage required.

## THE

## 'STORAGE PROBLEM’ SOLVERS

 DELUXE MATCHING STORAGE CASES FOR YOUR 12" RECORDS, $7^{\prime \prime}$ REELS, CASSETTES AND 8-TRACK CARTRIDGES.
(A) 60-unit cassette case. $131 / 2^{\prime \prime} h \times 125 / 8^{\prime \prime} d . \times 51 / 2^{\prime \prime} \mathrm{w}$. Compartments are tilted back to prevent spillage. Includes pres. sure-sensitive labels for tit
$\$ 14.75$ each 3 for $\$ 42.00$.

(D) 6 -unit $7^{\prime \prime}$ rool case. $8^{\prime \prime \prime}$ high $\times 71 / 2^{\prime \prime}$ deep $\times 5^{\prime \prime}$ wide. Holds reels in original boxes. $\$ 4.75$ each. 3 for $\$ 13.65$.
(E) $20-$ unlt $12^{\prime \prime}$ record case.
$131 / 4^{\prime \prime}$ high $\times 121 / 2^{\prime \prime}$ deep $\times 3^{1 / 2 "}$ " wide. Holds records in original jackels. $\$ 5.25$ each 3 for $\$ 13.75$

Here's the ideal solution to the problem of keeping all your records and tapes stored neatly, safely, conveniently and attractively. A complete set of matched storage cases, designed by the editors of STEREO REVIEW magazine, for your records and all your tapes: cassette, cartridge and $7{ }^{\prime \prime}$ reel. Now you can keep them side-by-side on your book shelf or cabinet, easy to dentify and readily available. These cases are sturdily constructed and covered in a handsome leatherette. The outer case is elegantly embossed in gold and comes in your choice of three popular decorator colors - black, brown and green - so that they lend themselves readily to the decor of any room.

STEREO REVIEW large capacity storage cases are just what you ve been looking for - they're the ideal solution to keeping your records and tapes neatly stored for easy use.

AN EXTRA SERVICE FOR YOUCHARGE YOUR STORAGE CASE ORDER TO YOUR AMERICAN EXPRESS OR UNI-CARD ACCOUNT.

Use the postage-paid order card located at the top of the flap to the right to order your Storage Cases.

## To get more from your high fidelity system...put more of yourself in it.

In these days of instant everything, the idea behind Electro-Voice Custom Loudspeakers is a refreshing change of pace.

The custom loudspeaker concept asks you to do more than buy. It suggests that you participate directly in choosing the very best speaker system for your own special listening needs, speaker by speaker.

There's a complete, logical range of woofers, tweețers mid-range drivers and accessories. And, with the help of your E-V dealer, you create the performance that suits you best.

You have the option of installing the speakers in new or existing furniture, or building them into walls, closets, or weerever.

Write today for our literature and ist of E-V Custom Loudspeaker dealers.

## Can the EVX-4 4-Channel Decoder face up to records encoded for Columbia SQ, Sansui, Dyna, and all the rest?

Yes. Listen. Play "their" best demonstration records through the EVX-4 or the E-V 1244X add-on decoder/stereo amplifier.

In most cases you'll hear little or no difference. Some records may even sound better to you through our decoder than through theirs! How can this be? Because you're listening to music ... not ping-pong or algebra. And our decoding is basic.

STEREO-4TM decoders can do the best job at the lowest cost for all 4-channel matrix records and FM broadcasts. Not to mention how well they enhance your present stereo records, tapes, and FM

But don't take our word for it. Listen carefully. Make your own discovery that "their" records can make the best case for "our" decoders!
