## SPECIFICATIONS

## GENERAL

Frequency Range $440-450 \mathrm{MHz}$
Frequency Step 5/10/15/20/25/50/100kHz
Frequency Stability ..... +/-10ppm
Antenna Impedance 50 ohms unbalancedSpeaker8 ohms
Microphone Condenser Mic. 1.2 kohms
Channel Display LCD 8 digits
Operating Temperature ..... $14^{\circ} \mathrm{F}$ to $140^{\circ} \mathrm{F}\left(-10^{\circ} \mathrm{C}\right.$ to $\left.60^{\circ} \mathrm{C}\right)$
Size $2 \times 4 \times 1$ Inches $(65 \times 117 \times 37 \mathrm{~mm})$
Weight $1 \mathrm{lb} 3 \mathrm{oz}(550 \mathrm{~g})$
Supply Voltage: Alkaline Battery Pack ..... 9 VDC
Ni-Cad Battery Pack (600mAh) ..... 7.2 VDC
Extemal Power Jack ..... 7.2 to 13.8 VDC
RECEIVER
Intermediate Frequency
1st IF ..... 45 MHz
2nd IF ..... 455 kHz
Sensitivity:
12dB SINAD ..... $0.2 \mu \mathrm{~V}$
20dB NQ ..... $0.3 \mu \mathrm{~V}$
Squelch Sensitivity:
Threshold ..... $0.1 \mu \mathrm{~V}$
Tight ..... $2.0 \mu \mathrm{~V}$
Spurious Response Attenuation ..... 60 dB
Intermodulation Attenuation ..... 60 dB
Adjacent Channel Rejection (25kHz) ..... 54 dB
Modulation Acceptance Bandwidth ..... 8 kHz
Hum and Noise ..... 43 dB
Audio Output Power (10\% THD):
7.2 V DC ..... 0.3W
9V DC ..... 0.5W
12V DC ..... 1W
13.8V DC ..... 1W
Audio Distortion ..... 2\%
Audio Response ..... $-6 d B / o c t$
Current Drain:
Standby Without Power Save ..... 43 mA
Standby With Power Save ..... 25 mA
CTCSS Sensitivity ..... $0.15 \mu \mathrm{~V}$

## TRANSMITTER

RF Power Output:
7.2V DC $(\omega / S T D$ NLCAD $)$ ..... 1.5W
9V DC ..... 2.4W
12V DC ..... 3.8W
13.8V DC ..... 5W
Low Power ..... 0.5W
Maximum Deviation ..... 4.5kHz
Hum and Noise ..... 40 dB
Audio Distortion ..... $1.5 \%$
Audio Response ..... +6dB/oct
Spurious and Harmonic Emissions ..... 70 dB
Frequency Error ..... $\pm 0.0005 \%$
Microphone Sensitivity ..... 2mVrms
CTCSS Tone Deviation ..... 0.7 kHz
DTMF Tone Deviation ..... 3.5 kHz
Current Drain:
7.2V DC ..... 0.6A
9V DC ..... 1.2A
12V DC ..... 1.8A
13.8V DC ..... 2A
Lower Power ..... 0.5A

Note: Nominal specs represent the design specs. All units should be able to approximate these-some will exceed and some may drop slightly below these specs. Limit specs represent the absolute worst condition that still might be considered acceptable; in no case should a unit fail to meet limit specs.

## DISASSEMBLY INSTRUCTIONS

1. To remove the belt clip, remove two screws (A).

2. To remove the battery ground plate:
A. Remove the battery pack.
B. Remove four screws (A) from the battery ground plate.

This also releases the latch mechanism.
Note the position of the latch plate and the latch button.
Then, remove the latch mechanism and button.

3. To access the RF board, remove five screws $(A)$ from the back cover and lift off the back cover. Then pull the RF section out from the top and lift it out of the case. Be careful not to pull the ribbon trace from either assembly when you remove the RF section.

4. To access the digital board
A. Remove two screws (A) from the PTT button.
B. Then, remove five screws $(B)$ from the shield plate.
C. Desolder the lithium battery from the shield plate.
D. Solder the lithium battery to ground on the RF board for testing.

5. To reassemble, follow the disassembly steps in reverse order.

## THEORY OF OPERATION

The $19-1140$ radio is comprised of two main populated PCBs (an RF PCB and a control PCB). The RF PCB contains the transmitter and receiver circuits. The control PCB contains the microprocessor controller and associated digital circuits and the keypad PCB.

## TRANSMITTER

The transmitter is comprised of:

- Microphone audio circuit
- Transmitter stage and harmonic filter
- Automatic power control
- Frequency synthesizer circuit

Microphone audio circuit
The audio signals from the microphone (via CON1001, pin 3) or the external microphone (via the MIC jack J4, flexible pin 2) are amplified, pre-emphasized, and limited by IC101 and associated components. The AF microphone signal is applied to the MIC module to produced an amplified and preemphasized audio signal. The signal is limited by IC101C/D and applied via VR1 to a low-pass filter (IC1-1A/B). The low-pass filter rejects frequencies above 3 kHz (outside the voice spectrum). The filtered signal is applied to the VCO pin 7 (within the frequency synthesizer circuit). RV1 is used to adjust voice deviation.

## Transmitter stage and harmonic filter

The power amplifier contains the RF power module IC5. When inthe transmit mode of operation,diodes D1 and D7 are forward biased, enabling the RF signal to pass to the input buffer Q2. The buffered RF signal is further amplified by the RF power module IC5. The amplified RF signal passes through the stripline coupler and is fed to the harmonic low-pass filter comprising L2 and C2O, L3, L4, and then to the antenna connector (ANT).

The coupler provides a sample of the RF signal for the automatic power control.

## Automatic power control

The automatic power control is modulized as the combination of $\mathbf{Q 7 0 1}$ to $\mathbf{Q 7 0 4}$ and contains the stripline coupler, diode D2, variable resistor VR2, two comparators (Q703 and Q702) and transistors Q704 and Q701. The RF signal present in the coupler is rectified by D2 to produce a DC vottage that is passed to VR2. The DC voltage is also applied to Q703 pin3 via VR2. The voltage TX 5V is applied to the base of 0702 via a potential divider. 0702 and $\mathbf{Q 7 0 3}$ determine the RF power level by producing a difference signal. The difference signal is passed to Q701 and Q704 to produce a constant power output to the antenna connector ANT. VR2 is used to adjust the RF power level.

## Frequency synthesizer circuit

With date received from the microprocessor (IC1006), the frequency synthesizer circuit controls and produces the RF carrier frequency for the transmitter during transmission and the local oscillator frequency for the receiver.

The frequency synthesizer circuit is comprised of:

- RX and TX voltage controlled oscillatior module
- Loop filter
- PLL frequency synthesizer and prescaler chip

RX and TX voltage controlled oscillator module
A VCO module produces carrier frequencies during transmission and the local oscillator frequency during reception. The module also has a power line filter.

## RX and TX power line filter

Transistor 0205 is configured as a 5 V (module, pin 5) power supply ripple filter.

## RX VCO

The RX VCO is comprised of a low noise transistor Q204, coil L204, and varactor D201 and D202 and is configured as a Colpit oscillator. D201 and D202 produce a change is frequency with a change in DC voltage and are controlled by the phase detector signal (via module pin 6) present at the anode. The local oscillator signal at the drain of $\mathbf{Q 2 0 1}$ is applied to pin 1 of the module, when D1 is reverse biased and D6 is forward biased. L204 is used for PLL alignment.

## TX VCO

When TX switching transistor 0203 is turned on by IC3 (via module pin 4), D203 is reverse biased and C202 is disconnected from the OSC tank circuit Then, the frequency range is changed for TX. The AF signal at the MIC AMP module pin 6 is applied to the anode of D201, D202 via pin 7 of the module. The control voltage from the loop filter is applied to the cathode of D201, D202 (via module pin 6). The TX RF modulated signal produced at the drain of $\mathbf{Q 2 0 1}$ (module pin1) is passed to the power amplifier and harmonic filter via the buffer amplifier (Q2), when diode D1 is forward biased and D6 is reverse biased.

## Loop filter

Resistors R51 and capacitors C80 to C81 are the loop filter. The phase detector from IC1 pin 6 is filtered by R50, 82, R49, C75 to remove any reference frequency harmonics and then applied to the RX and TX voltage controlled oscillator module pin6.

## PLL frequency synthesizer

The PLL frequency synthesizer contains an oscillator for the reference crystal, a reference divider, a programmable divider, a phase/frequency comparator, an out-of-lock detector an RX/TX switch, a power saving control switch, and a prescaler.

## Reference oscillator

The reference oscillator of IC1 along with a 12.8 MHz crystal $\mathrm{X} 1, \mathrm{TC} 1, \mathrm{C} 76, \mathrm{C} 77$ produces a 12.8 MHz reference signal at IC1 pins 1 and 2.

## Programmable dividers

IC1 has two dividers-a data programmable divider and a programmable reference divider.

## Phase detector

The phase detector (pin 6) produces negative pulses when $\mathrm{Fv}<\mathrm{Fr}$ and positive pulses when $\mathrm{Fv}>\mathrm{Fr}$. When $\mathrm{Fv}=\mathrm{Fr}$ and the phase is the same, the phase detector presents a high impedance at pin 6. The signal at pin 6 is applied to the VCO via the loop filter.

## Out-of-lock detector

The out-of-lock detector produces a high logic level when Fr and Fv are in the same phase and frequency, or low logic level pulses when the loop is out lock at pin 2 of IC1. The signals at IC1 pin 2 are buffered by $\mathrm{Q13}$ and then integrated by R45 and C78. The product of the integrating circuit is fed to flexible PCB 22.

## Prescaler

The internal prescaler divides the VCO frequency by 64 or 65.

## RECEIVER

The receiver uses dual-conversion superheterodyning techniques and is comprised of:

- RF amplifier
- First mixer and first IF amplifier
- Second mixer, second IF amplifier, and FM detector
- Receiver audio circuit
- Mute (squelch) circuit

## RF amplifier

The receiver RF amplifier contains tuned circuits L6 and L7 and RF transistor Q3 Helical resonator T1 is configured as a 2-pole bandpass filter. The RF signal passes through tuned circuits L6 and L7, RF amplifier $\mathrm{Q3}$, and T1, enabling the RF signal at the operating frequency to pass to the first mixer.

## First mixer and first IF amplifier

Crystal filter XF1 and coil T5 make up the first IF filter. The VCO local oscillator signal is applied via bandpass filter, C39, C40, and L8. Mixer transistor 04 produces a difference frequency of 21.4 MHz at the drain connection, from the filtered RF signal at the gate connection and the filtered VCO local oscillator signal at the source connection. The 45 MHz difference frequency is filtered by the 2 -pole crystal filter XF1. The tuned circuit T5 and associated components are matched to the crystal filter to insure good passband response and sensitivity. The IF signal is filtered by XF1 and passed to the second mixer, second IF, and FM detector.

## Second mixer, second IF, and FM detector

A signal conversion FM receiver integrated chip, IC4, contains the second mixer, second IF, and FM detector functions. The second local oscillator frequency is determined by the crystal X2 connected to IC4 pin 1. The IF signal is received at IC4 pin 16 . The second IF frequency of 455 kHz is produced when the difference frequency is applied to the mixer via pin 6 . The output of the second mixer via pin 3 is applied to a 455 kHz bandpass filter, CF1. The output of CF1 is passed to a high gain IF amplifier (limiter) in IC4 via pin 5 . The amplified signal is coupled to he adjustable quadrature detector T8. Any detected signal is produced at IC4 pin 9 and applied to the receiver audio circuit.

## Receiver audio circuit

The receiver audio circuit is made up of an audio amplifiers, a high-pass filter module, and a de-emphasis circuit on the RX/TX PCB.

## High-pass filter module

CTCSS signals from the recovered audio signal are removed by the high-pass filter. The high-pass filter is an 8 -pole active filter that is comprised of IC501 and associated components. The de-emphasis is provided by resistor R42 and capacitor C70. The de-emphasized audio signal at CON2, connection 6, is fed to the audio amplifier on the RX/TX PCB via the volume PCB VR801.

## Audio amplifier module

IC601 is the audio amplifier. The audio signal at CON2 pin 5 is passed to IC601 pin 3 via variable resistor VR801 (located on the front panel). The gain of the amplifier is set by resistor R603 and C602. The amplified audio signal at IC601 pin 5 is applied to the internal speaker SPKR by the flexible PCB (pin 5). The external speaker connection is via the connector JACK 3.

Mute (squelch) circuit
The squelch circuit switches off the audio power amplifier in the absence of RF signals. The squelch circuit is comprised of an internal carrier detector, squelch control, and VR802.

## Internal detector circuit

The carrier signal is detected by IC4 pin 13 and regulated by C57 and R33, and then DC amplified by the internal amplifier circuit via IC4 pin 10. The amplified signal is applied to IC4 pin 12 via SQ VR802 and then converted to logic level by the internal comparator of IC4. The output level is buffered and reverse phased by 011 and is applied as the busy signal to the microprocessor by flexible PCB pin 10.

## MICROPROCESSOR CONTROLLER

The default of all functions in the radio is preset by the internal programmed microprocessor, and any other user's options including the frequencies of receive and transmit, are available by the microprocessor and its associated interfacing circuit.

## Microprocessor

The microprocessor is a high-speed Hitachi HD404818 8K-byte ROM with 4-bit access. It contains the LCD driver, I/O controller and voltage comparator. When the radio turns on, the microprocessor is power-on reset by C1021 of pin 78 to operate in the preset order in the masked ROM. When the radio turns off the data in RAM ins stored by the backup battery with about $2 \mu \mathrm{~A}$ current from BAT1001 to pin 13.

## POWER SWITCHING CIRCUIT

When the PTT switch is pressed, the enable and clock data is forwarded by the microprocessor to IC1 pins 5, 6, 7, and to IC2 pins 1, 2, 3. When IC2 receives the enable and clock data, it holds pin 2 low, causing $\mathbf{Q 1}$ to turn on, and holds pin 14 high, causing 07 to turn off. It reverses this in receive mode.

## CTCSS/DTMF ENCODE AND DECODE CIRCUIT

## CTCSS receive

The detected audio signal is applied to IC1003 pin 11 for being switched out to pin 12, and then applied to IC1002 pin 8 to compare with OP AMP and passed to pin 3 to be applied to pin 13 through C1005 and R1005. It is further amplified and referenced by OP AMP to be passed to IC1003 pin 14. Again by the same procedure it is forwarded in to pin 1 and out to pin $\mathbf{2}$ to apply to the microprocessor pin 31 for the microprocessor control.

## CTCSS transmit

The data received from the microprocessor pins 17, 18, and 19 are applied to IC1003 pin 10 via R1028, R1029, R1030, and RV1002 for being switched at OC1003. The signal received at IC1002 pin 8 via pin 12 is filtered to pass to pin 3 and then to pin 14 for being switched to transmit by flexible PCB pin 26 via pin 25.

## DTMF decoding circuit

The audio detection output supplied to the Control Board is also applied to the bandpass filter pin 5 and passed to the DTMF Decoding IC (IC1007, pin 8) through the 8th active filter. With a data received from ICiO08 it is forwarded to pin 14 to apply to the microprocessor pin 31 for the microprocessor control.

## DTMF encoding circuit

When transmit DTMF is selected, the microprocessor pins $21,22,23$, and 24 and out the data which is forwarded into IC1004. The cross point switching IC (IC1003) makes the switched data forward to IC1004 pin 14 to transmit the DTMF signal through flexible PCB pin 26 via RV1001, C1025 and R1038.

## CONTROL AND INDICATOR CIRCUIT

## External PTT control circuit

When the external microphone is connected at the MIC jack on the front panel, the internal microphone is disabled and converted to the external microphone by the MIC AMP jack, which is applied to the VCO via C61 and also applied to the level PCB pin 1, to output the level PCB pin 2. Then the microprocessor pin 11, being pulled as logic high via R1036, becomes logic low to enable it to operate like the internal PTT circuit.

## Channel select circuit

The channel switch encodes the channel number selected into a binary word. The binary word is passed through the RF flexible PCB and the top panel PCB to the microprocessor pins 12 and 13 for the microprocessor control.

## Squelch level indicator

The received signal is applied to IC4 pin 11 to compare with the reference squelch level via R32 and is passed to the level PCB pin 8 for input to the microprocessor. The microprocessor then indicates the squelch level on the display.

## TX level indicator

The transmitted signal is applied to the level PCB IC301 B via direction couplers D2, RV3, and R31 to compare with the reference TX level and is then passed to the level PCB pin 8 for input to the microprocessor. The microprcessor then indicates the TX level on the display.

## Battery low indicator circuit

In case the battery voltage drops below approximately 6 V (it may depend on the voltage of the battery or power supply), the voltage comparator is applied to the level PCB pin 4 via R308 to compare with the reference (IC301 pin 10) and is then passed to the level PCB pin 3. The microprocessor then indicates BATT LOW on the display so the user will know that the battery must be replaced or recharged.

ALIGNMENT INSTRUCTIONS

## TROUBLESHOOTING HINTS

| Symptom | Probable Cause | Remedy |
| :---: | :---: | :---: |
| Unit does not work at all | 1. Defective power switch VR801 <br> 2. Defective diode D4, D5 <br> 3. Broken DC power cord | 1. Replace <br> 2. Replace defective component(s) <br> 3. Replace |
| No output from speaker at all | 1. Defective external speaker jack <br> 2. Poor connection on microphone connector <br> 3. Measure all the voltage of sub board on the audio PCB <br> 4. Defective internal speaker | 1. Repair or replace <br> 2. Repair or replace <br> 3. Repair or replace <br> 4. Replace |
| No noise on speaker | 1. Measure all the voltages of audio PCB <br> 2. Defective squelch circuit components (VR802, C57, C58, R28, R29, R30, R33, R34, R36, R1022, Q11, IC1006 pin 9) Compare with the voltage chart | 1. Repair or replace <br> 2. Replace defective component(s) |
| Squelch does not work | Defective squelch circuit components (VR802, C57, C58, R28, R29, R30, R33, R34, R36, R1022, Q11, IC 1006 pin 9 ) <br> Compare with the voltage chart | Replace defective component(s) |
| No modulation | 1. Defective microphone <br> 2. Measure all the voltages of sub board on the MIC PCB <br> 3. Defective TX mute circuit components (Q5, R3 pin 8 of IC1004) Compare with the voltage chart | 1. Replace <br> 2. Replace <br> 3. Replace defective component(s) |
| LCD does not work | Measure all the voltages of IC 1005, D1001, X1001 (IC1006 pin 77 ) | Replace defective component(s) |
| Back light does not work | Defective components of LED1001, LED1002, Q1001, Q1002, 01003 | Replace |

## ERROR DISPLAY

1. Internal RAM Error: Er1

Er 1 indicates an internal RAM error. It appears when the memory backup battery is dead or when something else has caused the memory contents to become corrupt. To clear the error, turn on the unit while pressing and holding the function button and $D$. This clears the memory.

If the error returns after you disconnect power, check the following components:

- Lithium battery
- Dual-diode RB417E (D1002)
- Cold solder joints

2. PLL Unlock Error: Er2

Er2 indicates the PLL has unlocked. Check the following:

- PLL alignment (from Page 18)
- 5 V at Q12, Q13 and VCO pin 7
- Confirm that X1 is oscillating. If not, check the connections to IC1 pins 1 and 2. If the connection is good, check for 5 V at IC1 pin 5 . If 5 V is not present, check connections to pin 5 and power.
- Confirm that there is a $\mathbf{5 k H z}$ signal at IC1 pin 2 . If it is not there, check connections to pin 19 (DT), pin 17 (EN), and pin 18 (CK).
- See if $\mathbf{Q 1 3}$ is normal.

If the error message does not go away, replace IC1.
